CAPACITORS; CAPACITORS, RECTIFIERS, DETECTORS, SWITCHING DEVICES, LIGHT-SENSITIVE OR TEMPERATURE-SENSITIVE DEVICES OF THE ELECTROLYTIC TYPE

Kondensatoren; Kondensatoren, Gleichrichter, Detektoren, Schaltvorrichtungen, lichtempfindliche oder temperaturempfindliche Bauelemente des elektrolytischen Typs

CAPACITOR STRUCTURE AND CAPACITOR USING THE SAME

Embodiments of the present invention provide a capacitor structure. The capacitor structure comprises: a first plurality of metal plates (P31, P33, P35; P51, P53, P55; P61, P63, P65) that are vertically disposed with their surfaces being parallel to each other; a second plurality of metal plates (P32, P34, P36; P52, P54, P56; P62, P64, P66) that are interdigitated with the first plurality of metal plates with their surfaces being parallel to the surfaces of the first plurality of metal plates; a first port (Port1) electrically connected to each of the first plurality of metal plates (P31, P33, P35; P51, P53, P55; P61, P63, P65) through a first plurality of port connecting strips (S1, S3, S5) and via a first port via interconnection (V31, V51, V61); and a second port (Port2) electrically connected to each of the second plurality of metal plates (P32, P34, P36; P52, P54, P56; P62, P64, P66) through a second plurality of port connecting strips (S2, S4, S6) and via a second port via interconnection (V32, V52, V62). The first plurality of metal plates (P31, P33, P35; P51, P53, P55; P61, P63, P65) is connected together at an end of each of the first plurality of metal plates opposite to the end at which the first port is connected. The second plurality of metal plates (P32, P34, P36; P52, P54, P56; P62, P64, P66) is connected together at an end of each of the second plurality of metal plates opposite to the end at which the second port is connected. A direction in which the first plurality of port connecting strips extends (S1, S3, S5) is in a certain angle with the direction in which the second plurality of port connecting strips (S2, S4, S6) extends.

ELECTROLYTE SOLUTION FOR DRIVING ELECTROLYTIC CAPACITOR

Provided is an electrolyte solution for driving an aluminum electrolytic capacitor, especially one for medium and high voltages, which has high withstand voltage and excellent long service life characteristics at high temperatures. An electrolyte solution for driving an electrolytic capacitor, which is characterized in that a salt of a compound that has an aromatic ring wherein at least one group containing a carboxyl group is substituted, said group containing a carboxyl group being substituted to the aromatic ring via a carbon atom or an oxygen atom, is dissolved in an organic solvent.

PHOTOELECTRIC CONVERSION ELEMENT

This photoelectric conversion element has at least one photoelectric conversion cell. The photoelectric conversion cell has: a first base material having a transparent substrate; a second base material facing the first base material; and an oxide semiconductor layer that is provided between the first base material and the second base material. At least one photoelectric conversion cell has a sealing section that connects together the first base material and the second base material of at least the one photoelectric conversion cell, and the sealing section has a first sealing section that is provided between the first base material and the second base material. The first sealing section has an annular outer sealing section, and at least one inner sealing section, which is provided on the inner side of the outer sealing section so as to form the same number of cell spaces as the photoelectric conversion cells, and the thickness of the outer sealing section is more than that of the inner sealing section.

CONNECTION STRUCTURE FOR COLLECTOR AND CAPACITOR PROVIDED WITH CONNECTION STRUCTURE

&X03000;Provided is a connection structure for a collector that minimizes electrical resistance, and reduces the likelihood of weld defects. Said structure can also be applied to a capacitor such as a lithium ion capacitor. A collector (7) is connected to a lid member (9) via first and second leads (15, 17). The first lead (15) extends from the collector (7) of an electrode plate group accommodated in a case body (3), and the second lead (17) comprises three aluminum plates having one end fixed to the bottom surface of the lid member (9). A stepped part (17d) in which the end parts of the three aluminum plates are formed in a mutually displaced state is provided to an end part of the second lead (17). The first lead (15) and the second lead (17) are welded before attaching the lid member (9) to the case body (3). If the welding is performed at a position set apart from the planned position, some or all of the stepped part (17d) formed by the three aluminum plates provided at the other end of the second lead (17) disappears during welding, making it possible, even visually, to readily detect faulty welding.

WINDING-TYPE STACKED BODY FOR CONDENSER WITH HIGH CAPACITANCE AND STACKED WINDING-TYPE CONDENSER USING SAME

The purpose of the present invention is to provide a winding-type stacked body for a condenser capable of realizing a high capacitance and a high degree of resistance to voltage. The purpose is accomplished by a winding-type stacked body for a condenser, comprising a metal layer and a dielectric layer, wherein the dielectric layer exists on the metal layer, two metal layers having the dielectric layers constitute a pair and are stacked and wound to configure the winding-type stacked body, which comprises no plastic film.

CATALYTIC CARBON COUNTER ELECTRODE FOR DYE-SENSITIZED SOLAR CELLS

A carbon catalyst layer for electrolyte based tri-iodide/iodine redox couples includes amorphous carbon, oxygen, silicon, tin and fluorine. The catalyst layer can be coated on a transparent conducting oxide (TCO) glass substrate for use as a counter electrode in a dye- sensitized solar cell (DSSC). By annealing the coated carbon catalyst layer at a temperature between approximately 250 - 650 °C (e.g., 300 - 600 °C) to establish an appropriate sp3 orbital fraction, the carbon catalyst layer can have low electrical resistivity, high electro-catalytic activity, and excellent photoelectric conversion efficiency, which has been measured as 98.32% of that of a DSSC having a conventional platinum catalyst based counter electrode.

PROCESS FOR PRODUCING THIN-FILM POLYMER LAMINATED FILM CAPACITOR, AND THIN-FILM POLYMER LAMINATED FILM CAPACITOR

A process for producing a thin-film polymer laminated film capacitor, including a laminate production step which comprises: conducting a resin thin-film layer formation step and a metal thin-film layer formation step on a rotating drum alternately repeatedly; and thus forming, on the rotating drum, a laminate in which resin thin-film layers and metal thin-film layers are alternately laminated. The resin thin-film layer formation step comprises: evaporating a monomer in a vacuum chamber to form a monomer layer; irradiating the monomer layer with an electron beam to cure the monomer layer; and thus forming a resin thin-film layer. The metal thin-film layer formation step comprises evaporating a metal material to form a metal thin-film layer. In the resin thin-film layer formation step, the monomer layer is formed using a dimethacrylate compound having an alicyclic hydrocarbon skeleton as the monomer, said dimethacrylate compound being represented by chemical formula (1) [wherein A is an organic group that contains an alicyclic hydrocarbon]. The present invention can enhance the hardness of the resin thin-film layers sufficiently, thus enabling the production of a thin-film polymer laminated film capacitor having desired performance.

CAPACITOR

The present invention provides a capacitor that has high mechanical strength. The capacitor according to the present invention comprises: a porous metal substrate; a dielectric layer that is formed upon the porous metal substrate; an upper electrode that is formed upon the dielectric layer; a first terminal electrode that is electrically connected to the porous metal substrate; and a second terminal electrode that is electrically connected to the upper electrode. The porous metal substrate has a high-porosity part and low-porosity parts, the low-porosity parts being located at a pair of side-surface parts that are opposite each other on the porous metal substrate.

ELECTROCHEMICAL DEVICE, AND PRODUCTION METHOD

[Problem] To provide an electrochemical device and a production method, with which peeling between an electrode adhesive layer and a case can be suppressed. [Solution] This electrochemical device (100) is provided with: a case (10); an electrical storage element (13); and an adhesive layer (19). The case (10) is provided with: terminal parts (14); a case main body (11) provided with a first inner surface (11a) having the terminal parts (14) provided thereto; and a conductive lid (12) which is bonded to the case main body (11), and which is provided with a second inner surface (12a) that faces the first inner surface (11a). The electrical storage element (13) is provided with: a first electrode (13a) which is fixed to the first inner surface (11a); and a second electrode (13b) which is fixed to the second inner surface (12a), and which faces the first electrode (13a) with an electrolyte solution provided therebetween. The adhesive layer (19) is configured from a cured product of a conductive adhesive material, said cured product being provided with at least one cavity portion (19c). Furthermore, the adhesive layer (19) electrically connects the first electrode (13a) and the terminal parts (14), and is disposed between the first electrode (13a) and the first inner surface (11a).

ELECTRIC MODULE AND MANUFACTURING METHOD FOR ELECTRIC MODULE

An electric module characterized by being provided with: a photoelectrode in which a semiconductor layer is formed on a first substrate on which a first conductive film is formed; a counter electrode provided with a second substrate on which a second conductive film is formed; and an electrolyte, and in that the photoelectrode and the counter electrode are bonded and sealed so as to form an internal space therebetween, the electrolyte is filled into the internal space, at least part of a sealed portion between the photoelectrode and the counter electrode is formed by bonding the first conductive film and the second conductive film by a sealing member, the first conductive film and/or the second conductive film extends to the outside of the internal space beyond the sealing member while being electrically continuous from the internal space, and a conductive material is disposed on the surface of an extension portion while enabling continuity with the portion.

DIELECTRIC MATERIAL AND CAPACITOR COMPRISING THE DIELECTRIC MATERIAL

A dielectric material suitable for use in an electronic component includes bismuth ferrite, strontium titanate and an additive. The additive comprises barium titanate. The barium titanate reduces the temperature capacitance change of the dielectric material and allows for increased working voltages. The material is useful for the construction of capacitors, and particularly capacitors intended for use at high temperatures. Also provided are a capacitor including the dielectric material, methods of manufacturing the dielectric material and the capacitor, and the use of an additive to improve the lifetime and/or reduce the dissipation factor of a capacitor.

CAPACITOR AND METHOD FOR CHARGING AND DISCHARGING SAME

This capacitor comprises a positive electrode, a negative electrode, a separator that is interposed between the positive electrode and the negative electrode, and an electrolyte. The positive electrode comprises a positive electrode collector and a positive electrode active material that is supported by the positive electrode collector. The positive electrode active material contains activated carbon, and this activated carbon has a carboxyl group. The desorption amount of carboxyl groups per unit mass of the activated carbon if heated from 300°C to 500°C is 0.03 μmol/g or less. This capacitor has an upper limit voltage (Vu) for charging and discharging. The upper limit voltage (Vu) of a lithium ion capacitor is 4.2 V or more, while the upper limit voltage (Vu) of an electric double layer capacitor is 3.3 V or more.

PHOTOASSISTED HIGH EFFICIENCY CONVERSION OF CARBON-CONTAINING FUELS TO ELECTRICITY

Electricity is generated by oxidizing a carbon-containing fuel in a photoelectrochemical fuel cell via a cyclic oxidation pathway to yield carbon dioxide and water, and collecting the electrons released via the cyclic oxidation pathway to yield a flow of electrons. The cyclic oxidation pathway includes a series of reactions of which is a photooxidation reaction. Photooxidation triggers one or more dark oxidation reactions, thereby increasing the efficiency of the photoelectrochemical fuel cell.

ELECTROCHEMICAL DEVICE

An electrochemical device is provided with an electric storage element that is constituted by a first electrode sheet, a second electrode sheet, and a separate sheet installed between the two electrode sheets. The separate sheet includes: a first part (high liquid absorptivity part) sandwiched between the two electrode sheets; a second part (low liquid absorptivity part) extending outward from the two electrode sheets; and a third part (contact part) in contact with a rim surface of the second electrode sheet, whereby the electrochemical device can quickly and reliably resolve a phenomenon of the amount of electrolyte decreasing in the part of the separate sheet sandwiched between the two electrode sheets, even if the phenomenon occurs frequently.

ELECTROLYTE SOLUTION AND ELECTROCHEMICAL DEVICE

The present invention aims to provide an electrolyte solution that is less likely to lead to an increase in resistance and realizes high capacity retention factor even after continuous application of a high voltage, and to provide an electrochemical device. The present invention provides an electrolyte solution including: a nitrile compound; and a quaternary ammonium salt, the electrolyte solution having a potassium ion content of less than 10 ppm, a moisture content of 20 ppm or less, a tertiary amine content of 30 ppm or less, a heterocyclic compound content of 30 ppm or less, and an ammonia content of 20 ppm or less.

CURRENT COLLECTOR, ELECTRODE, SECONDARY CELL, AND CAPACITOR

Provided are a current collector which has an excellent high-rate property and exerts a sufficient safety function when employed in a secondary battery or a capacitor, as well as an electrode, a secondary battery or a capacitor in which said current collector is employed. According to the invention, a current collector is provided which comprises: metal foil; and a conductive layer with a film thickness of 0.1 μm to 10 μm formed on a surface of said metal foil. Here, said conductive layer includes a conductive material and a binder material. A melting point of said binder material is 80° C. to 150° C. Further, said binder material shows, in differential scanning calorimetry (DSC) in a range from room temperature to 200° C., one or more endothermic peaks in the heating-up process. In a case where said binder material shows two or more endothermic peaks, each difference between said peaks is 15° C. or more. Moreover, said binder material shows one or more exothermic peaks in the cooling-down process. In a case where said binder material shows only one exothermic peak, said exothermic peak falls within a range of 50 to 120° C., and a width at half maximum of said exothermic peak is 10° C. or less. On the other hand, in a case where said binder material shows two or more exothermic peaks, a maximum exothermic peak among said exothermic peaks falls within a range of 50 to 120° C., and a width at half maximum of said exothermic peak is 10° C. or less.

METHOD AND SYSTEM FOR REDUCING AUDIBLE AND/OR ELECTRICAL NOISE FROM ELECTRICALLY OR MECHANICALLY EXCITED CAPACITORS

Devices and methods are disclosed for reducing vibration and noise from capacitor devices. The device includes a circuit board, and first and second capacitor structures. The second capacitor structure has substantially the same properties as the first and is coupled to the opposite face of a supporting structure substantially opposite of the first capacitor structure. The first and second capacitor structures can receive substantially the same excitation signals, can be electrically connected in parallel or in series. The first and second capacitor structures can be discrete capacitors, capacitor layers, stacks or arrays of multiple capacitor devices, or other capacitor structures. Stacks of multiple capacitor devices can be arranged symmetrically about the supporting structure. Arrays of multiple capacitor devices can be arranged with offsetting capacitors on the opposite face of the supporting structure substantially opposite one another.

HIGH ENERGY DENSITY ELECTROSTATIC CAPACITOR

A solid state electrical energy state storage device includes multiple dielectric layers or an integral heterogeneous dielectric layer. Layers or portions of the heterogeneous layer have permittivity augmented by exposing the dielectric material to electric/magnetic fields during formation of the dielectric before complete solidification. Such exposure results in radicals and/or an ordered matrix. A dielectric for the device may contain a new xylene based polymer formed under atmospheric conditions via reaction with monatomic oxygen and provided an augmented permittivity through exposure of the polymer to a magnetic field and/or an electric field during condensation and solidification on a substrate.

METHOD FOR FILLING AT LEAST ONE CAVITY OF A MULTI-LAYER COMPONENT WITH A FILLING MATERIAL, AND MULTI-LAYER COMPONENT

The invention relates to a method for filling at least one cavity (5a, 5b) of a multi-layer component (1) with filling material (9). In a first step, the method comprises providing a main body (2) of the multi-layer component (1), the main body (2) having at least one cavity (5a, 5b). In a subsequent step, the method comprises placing the main body (2) in a chamber (11) and then generating a first pressure, the first pressure being a negative pressure. Then, a filling material (9) is arranged on the main body (2). Furthermore, the invention relates to a multi-layer component (1). The multi-layer component (1) has a main body (2) with at least one cavity (5a, 5b), wherein the cavity (5a, 5b) is filled with a filling material (9) which has a viscosity of between 200 mPas and 2000 mPas.

VARIABLE CAPACITOR COMPROMISING MEMS DEVICES FOR RADIO FREQUENCY APPLICATIONS

A variable capacitor (300) comprises cells (200, 400) that have an RF electrode (202, 402) coupled to a bond pad (30). Each cell comprises a plurality of MEMS devices (100) the capacitance of which can be changed by means of a movable electrode. The MEMS devices are placed in a sealed cavity of the cell and are arranged next to each other along the length of the RF electrode of the cell. The RF electrode of each cell can be trimmed so as to obtain an RF line (402) and a further ground electrode (404) and so as to scale the RF capacitance of the cell without impacting the mechanical performance of the MEMS cells. Each cell has the same control capacitance irrespective of the RF capacitance. This allows each cell to use the same isolation resistor required for RF operation and thus each cell has the same parasitic capacitance. This allows the CMOS control circuit to be optimized and the dynamic performance of the cells to be matched.

Electrode material, preparation method thereof and supercapacitor based thereof

The disclosure discloses electrode material, preparation methods thereof and supercapacitors based thereof. Raw material for preparing the electrode material include PVDF and an additive which can be reacted with the PVDF to generate conductive active substance, the amount of the PVDF is 50 to 99 mass percentage, and the amount of the additive is 1 to 50 mass percentage. A PVDF-based composite film can be prepared from the raw materials; and activating treatment is performed on the film by virtue of a physico-chemical process, so that PVDF can generate a conductive active substance, the contact resistance of the PVDF and the active substance is reduced, and the conductive active substance is distributed in the PVDF-based composite film more uniformly. Button and wound supercapacitor and flexible capacitor, which are prepared from the electrode material, are high in power density and energy density, long in cycle life.

CONDUCTIVE MATERIAL WITH CHARGE-STORAGE MATERIAL IN VOIDS

A conductive material includes a graphene-nanonsheet material, with charge-storage material in voids in and/or coating the graphene material. The charge-storage material may include any of a variety of types of carbon, including carbon black, acetylene black, furnace black, carbon fibers, carbon nanotubes, graphene in the form of wrinkled sheets of graphene, carbon nano-onions, or hydrothermal-synthesized nanospheres of carbon material. Alternatively, the charge-storage material may be non-carbon pseudocapacitive materials. Also, the charge-storage material may involve Faradaic processes similar to those observed with battery electrodes. The conductive material may be formed or placed on a conductive or a dielectric substrate. One or more gaps may be formed in the conductive material, with the conductive material forming two or more electrodes. The electrodes may then be covered with an electrolyte material, to produce an electric double layer capacitor.

POWER STORAGE DEVICE POSITIVE ELECTRODE, POWER STORAGE DEVICE, AND METHOD FOR PRODUCING SLURRY FOR POWER STORAGE DEVICE POSITIVE ELECTRODE

A higher performance positive electrode for a power storage device is provided, which ensures a higher capacity density per unit weight of an active substance and, particularly, a higher initial capacity in initial charge/discharge. The power storage device positive electrode includes electrically conductive polymer particles as an active substance, and the electrically conductive polymer particles each have a flat shape.

SEALING MATERIAL, METHOD OF MANUFACTURING FLEXIBLE THIN-FILM TYPE SUPER-CAPACITOR DEVICE USING THE SAME, AND SUPER-CAPACITOR DEVICE MANUFACTURED BY THE METHOD

Disclosed are a method of manufacturing a flexible thin-film type super-capacitor device and a super-capacitor device manufactured by the same. The flexible thin-film type super-capacitor device comprises a base film which has flexibility; a separator which is interposed between the base films; and an active material which is formed on the base film. Thus, flexibility is given since thickness is very thin while maintaining high electrical conductivity and high binding property. In addition, economic feasibility is high and mass production is possible. Further, it is possible to stably and efficiently contain a highly corrosive material.

NON-UNIFORM DIELECTRIC LAYER CAPACITOR FOR VIBRATION AND ACOUSTICS IMPROVEMENT

A Non-Uniform Dielectric Layer, Multi-Layer-Ceramic-Capacitor (MLCC) has upper and lower dielectric layers separating upper and lower electrode layers, where the lower dielectric layers have a greater vertical thickness than the upper dielectric layers to reduce piezoelectric effect driven capacitor reaction forces on a printed circuit board (PCB) on which the capacitor is mounted. Such an MLCC may include an upper set of dielectric layers that separate adjacent pairs of upper electrode layers in a top portion of the MLCC, and a lower set of dielectric layers that separate adjacent pairs of lower electrode layers in a bottom portion of the MLCC. A bottom portion of the MLCC may be mounted on a PCB. The thickness of the lower dielectric layers may be between 1.5 and 3.5 times greater than the upper dielectric layers to reduce piezoelectric effect driven capacitor reaction forces in the audio range of human hearing.

BI- AND TRI- LAYER INTERFACIAL LAYERS IN PEROVSKITE MATERIAL DEVICES

Photovoltaic devices such as solar cells, hybrid solar cell-batteries, and other such devices may include an active layer disposed between two electrodes. The active layer may have perovskite material and other material such as mesoporous material, interfacial layers, thin-coat interfacial layers, and combinations thereof. The perovskite material may be photoactive. The perovskite material may be disposed between two or more other materials in the photovoltaic device. Inclusion of these materials in various arrangements within an active layer of a photovoltaic device may improve device performance. Other materials may be included to further improve device performance, such as, for example: additional perovskites, and additional interfacial layers.

Enhanced charge-storage electrochemical double layer capacitors with nanoscale electrolyte confinement tunability, and a method for production thereof to obtain axi-symmetric, high surface area electrode growth

An enhanced energy storage device such as double layer capacitor or battery is made starting with a substrate capable of conducting stored energy. The substrate material is one in which ordered pores can be formed, creating a template of densely arrayed pores. An electrode comprised of high density carbon nanotubes within the template is grown from and oriented substantially perpendicular to the substrate to constitute an axi-symmetric, ultra-high surface area electrode, and then the template is then selectively and only partially etched. An electrolyte is structurally confined anisotropically around the nanotubes by a remaining portion of the selectively and partially etched template so that substantially enhanced energy storage is obtained. The optimal structural confinement, which causes optimal charge storage, depends upon the amount of partial etching of the template which is defined by the electrolyte selected.

ELECTROLYTIC SOLUTION FOR ELECTROLYTIC CAPACITOR, AND ELECTROLYTIC CAPACITOR

Provided is an electrolytic solution suitable for use in a 100 WV class electrolytic capacitor having low inductance at low temperatures and high durability in high-temperature use conditions. This electrolytic solution for an electrolytic capacitor contains: a mixed organic solvent including sulfolane and γ-butyrolactone; water; an electrolyte selected from the group consisting of a quaternized pyridinium salt of carboxylic acid and a quaternized imidazolinium salt of carboxylic acid; boric acid; and mannitol; and has a mass ratio of boric acid and mannitol in the range of 1:l .2 to 1:1.6, and a total amount of boric acid and mannitol of 10.0 to 14.5 % by mass of the total electrolytic solution, the water content being 1.5 to 2.0 % by mass of the total electrolytic solution.

POLYMER SOLAR CELL AND PREPARATION METHOD THEREOF

Disclosed are a polymer solar cell and a preparation method thereof. The preparation method comprises: successively preparing on a clean glass substrate(1), a cathode (2), an electronic buffer layer (3) and an active layer (4) by the steps of dissolving poly(3,4-ethylenedioxythiophene) and polymerized p-styrene sulphonic acid, dissolving zinc oxide into acetic acid to obtain a zinc oxide solution, mixing the zinc oxide solution with the solution of poly(3,4-ethylenedioxythiophene) and polymerized p-styrene sulphonic acid to obtain a mixed solution, spin-coating the mixed solution on the active layer(4) and then by drying to obtain the anode (5), and finally obtain the polymer solar cell. Using the refractive index difference between the anode and the active layer, the light absorption and energy conversion efficiency of a polymer solar cell are improved, resulting in a simple preparation process, and the use of a reversed structure facilitates improving the lifetime of a polymer solar cell and enables the product and method to have industrialized application prospects.

COLLECTOR, ELECTRODE STRUCTURE, NONAQUEOUS ELECTROLYTE BATTERY, CONDUCTIVE FILLER, AND ELECTRICITY STORAGE COMPONENT

The present invention provides a current collector having a conductive layer which is excellent in adhesion strength and can exhibit a PTC function for stably contributing to safety, when used for an electrode structure for non-aqueous electrolyte batteries or for electrical storage devices. A current collector, including a metal foil and a conductive layer formed on at least one side of the metal foil, the conductive layer being formed partially or entirely on the surface of the metal foil; is provided. Here, the conductive layer contains core shell particles including core particles 114 having insulating crystalline polymer as a main component, and a shell layer 116 having conductivity, the shell layer 116 being formed on the surface of the core particles 114.

Gel-type polymer electrolyte comprising eutectic mixture and an electrochemical device containing the same

A gel-type polymer electrolyte is provided which comprises a eutectic mixture. The eutectic mixture is composed of: (a) a heterocyclic compound selected from imidazole, pyrazole, triazole, pyrimidine, 4-isopropylimidazole, 4-methylimidazole, ethoxypyridine and N-ethylimidazole; and (b) an ionizable lithium salt. The gel-type polymer electrolyte is formed by polymerization of the eutectic mixture and a precursor solution containing a polymerizable monomer.

NONAQUEOUS ELECTROLYTE SOLUTION, ELECTROCHEMICAL DEVICE, LITHIUM ION SECONDARY CELL, AND MODULE

The present invention aims to provide a nonaqueous electrolyte solution which enables production of a lithium ion secondary cell excellent in high temperature storage characteristics and cycling characteristics at high voltages. The present invention relates to a nonaqueous electrolyte solution including: a nonaqueous solvent; and an electrolyte salt; wherein the nonaqueous solvent contains a fluorinated linear carbonate (A) represented by Formula (1):   RfOCOOR   (1) where Rf represents a C1-4 fluorinated alkyl group and R represents a C1-4 alkyl group, and at least one cyclic carbonate (B) selected from the group consisting of ethylene carbonate, propylene carbonate, and fluoroethylene carbonate, and the nonaqueous solvent also contains at least one compound (α) selected from the group consisting of (I) a compound represented by Formula (2):   RfOH   (2) where Rf is defined as above, (II) a compound represented by Formula (3)   ROH   (3) where R is defined as above, and (III) a compound represented by Formula (4):   ROCOCl   (4) where R is defined as above, and at least one compound (ß) selected from the group consisting of (IV) a compound represented by Formula (5):   HO(CH2CH2)nOH   (5) where n is an integer of 1 to 5, (V) a compound represented by Formula (6):   HO(CHCH3CH2)nOH   (6) where n is an integer of 1 to 5, and (VI) a compound represented by Formula (7):   HO(CHFCH2)nOH   (7) where n is an integer of 1 to 5, the compound (α) being contained in an amount of 5000 ppm or less based on the amount of the fluorinated linear carbonate (A), the compound (ß) being contained in an amount of 50 ppm or less based on the amount of the cyclic carbonate (B).

ELECTRIC DOUBLE LAYER CAPACITOR

Elektrischer Doppelschichtkondensator, umfassend eine polarisierbare Elektrodenschicht, die einen aktivierten Kohlenstoff, ein leitfähiges Agens und ein Bindemittel enthält, worin ein äußerer spezifischer Flächeninhalt des aktivierten Kohlenstoffs, der als ein spezifischer Flächeninhalt pro Volumeneinheit der polarisierbaren Elektrodenschicht definiert ist, der durch ein t-plot-Verfahren unter Ausschluss von Mikroporen mit einem kleineren Porendurchmesser als 2 Nanometer (20 Ängström) aus einer Stickstoffabsorptionsisotherme berechnet wird, in einem Bereich von 450 bis 800 m2/cm3 liegt, und ein auf Partikelzwischenräumen beruhendes Volumen pro Volumeneinheit der polarisierbaren Elektrodenschicht, das gemäß dem in dieser Beschreibung erwähnten Verfahren berechnet wird, in einem Bereich von 0,05 bis 0,12 cm3/cm3 liegt, dadurch gekennzeichnet, dass: eine relative Partikelmenge pro Volumen in einem Modendurchmesser einer Partikelgrößenverteilung in dem aktivierten Kohlenstoff in einem Bereich von 10 bis 30% liegt.

Folienkondensator

Die Erfindung nennt einen Folienkondensator (1), umfassend eine Mehrzahl von Lagen (2) von Dielektrikumsfolien (4a-4c), eine mit einem ersten Anschluss (12a) kontaktierte erste Kontaktschicht (10a) an einer ersten Stirnseite der Lagen (2), und eine mit einem zweiten Anschluss (12b) kontaktierte zweite Kontaktschicht (10a) an einer zweiten Stirnseite der Lagen (2), wobei auf mindestens jede zweite Dielektrikumsfolie (4a, 4c) mindestens einseitig eine Metallisierungsschicht (8a, 8b) aufgebracht ist, und wobei jede Metallisierungsschicht (8a, 8b) entweder mit der ersten Kontaktschicht (10a) oder mit der zweiten Kontaktschicht (10b) kontaktiert ist. Hierbei ist vorgesehen, dass sich die Dicke wenigstens einer Metallisierungsschicht (8a, 8b) von der mit ihr kontaktierten Kontaktschicht (10a, 10b) weg entlang ihrer Auftragungslänge verjüngt, wobei entlang einer Strecke, welche senkrecht zur Kontaktschicht (10a, 10b) bis zum der Kontaktschicht (10a, 10b) abgewandten Rand der Metallisierungsschicht (10a, 10b) führt, die durchschnittliche Dicke der Metallisierungsschicht (8a, 8b) über die der Kontaktschicht (10a, 10b) angrenzenden Hälfte der Strecke mindestens 50% mehr beträgt als die durchschnittliche Dicke der Metallisierungsschicht (8a, 8b) über die der Kontaktschicht (10a, 10b) abgewandten Hälfte der Strecke, und/oder, dass bei wenigstens einem Paar von zwei aufeinander folgenden Dielektrikumsfolien (4a, 4c), auf die an den einander zugewandten Seiten jeweils eine mit der jeweils selben Kontaktschicht (10a, 10b) kontaktierte Metallisierungsschicht (8a, 8b) aufgebracht ist, eine Dielektrikumsfolie (4a, 4c) an dem dieser Kontaktschicht (10a, 10b) zugewandten Rand eine durch eine Anzahl von Aussparungen (22a, 22b, 28a) gebildete Kontur (20a, 20b) aufweist, und/oder, dass die erste Kontaktschicht (10a) und die zweite Kontaktschicht (10b) jeweils von einer Metallplatte (32) bedeckt sind.

METHOD OF MANUFACTURING ELECTRONIC COMPONENT WITH TERMINAL PLATE, AND ELECTRONIC COMPONENT WITH TERMINAL PLATE

PROBLEM TO BE SOLVED: To provide a method capable of achieving improvement in productivity and bonding reliability and reduction in damage to a chip-type electronic component when terminal plates are soldered to terminal electrodes of the chip-type electronic component.SOLUTION: The method of manufacturing an electronic component with terminal plates bonds terminal plates 16 and 17 formed of metal plates to terminal electrodes 14 and 15 formed on both opposite end surfaces of a chip-type electronic component 2 by a solder. A cream solder 18a is applied to outer surfaces of the terminal electrodes 14 and 15, the electronic component 2 is inserted between the terminal plates 16 and 17, and the terminal plates 16 and 17 are pressed toward the terminal electrodes by a pair of heating elements 152 to thermocompression-bond the terminal plates to the terminal electrodes, thereby obtaining the electronic component 2 having the terminal plates temporarily fixed thereto. The electronic component 2 having the terminal plates temporarily fixed thereto is heated in a heating furnace 153 to permanently bond the terminal plates to the electronic component 2 by melting of the cream solder 18a, thereby obtaining an electronic component 1 with terminal plates.COPYRIGHT: (C)2015,JPO&INPIT

(54) NONWOVEN FABRIC SEPARATOR FOR ELECTROCHEMICAL ELEMENTS

(57) Abstract:

PROBLEM TO BE SOLVED: To provide: a method for manufacturing a nonwoven fabric separator for electrochemical elements with cellulose blended therein by which curl that would be a problem in an assembly process of an electrochemical element even when exposed to a low-humidity environment is not caused; and a nonwoven fabric separator for electrochemical elements.

SOLUTION: A method for manufacturing a nonwoven fabric separator for electrochemical elements comprises: a step of leaving a piece of nonwoven fabric with cellulose blended therein in contact with a roll heated at a temperature of 100 or more and 160°C or less for at least one second under the condition of a moisture percentage 12.0 mass% or less. A nonwoven fabric separator for electrochemical elements is manufactured by the above manufacturing method.

LITHIUM ION CAPACITOR

PROBLEM TO BE SOLVED: To provide a lithium ion capacitor superior in low-temperature characteristic and superior from the viewpoint of safety.SOLUTION: A lithium ion capacitor comprises: a positive electrode active material; a carbon material as a negative electrode active material; and a nonaqueous electrolytic solution. The nonaqueous electrolytic solution includes cyclic carbonate, chain carbonate and γ-butyrolactone. In the lithium ion capacitor, the content of the γ-butyrolactone is 15-50 vol.% to the total volume of the nonaqueous electrolytic solution.COPYRIGHT: (C)2015,JPO&INPIT

HIGH-VOLTAGE CAPACITOR, AND HIGH VOLTAGE GENERATION DEVICE EMPLOYING HIGH-VOLTAGE CAPACITOR

PROBLEM TO BE SOLVED: To prevent an insulation oil from penetrating into a high-voltage capacitor around which dielectric films with conductor foils formed therein are wound in a roll shape.SOLUTION: A high-voltage capacitor is formed by overlapping and winding two dielectric films in which a plurality of conductor foils are formed in a length direction while being spaced in a width direction on one side of the dielectric films. The two dielectric films are formed with an equal width and an equal interval of the conductor foils. The high-voltage capacitor includes a capacitor body 50 formed by deviating positions of both end portions of one of conductor foils which are overlapped with the dielectric film interposed therebetween, in the width direction so as to oppose the other neighboring two conductor foils. In the outer circumference of the capacitor body 50, resin insulation layers 56 and 58 are formed by winding a sheet impregnating a resin in an unwoven fabric. On a boundary surface between the resin insulation layers 56 and 58 and the capacitor body 50, an adhesion layer 59 is interposed that is formed by performing heat treatment on the resin insulation layers 56 and 58.COPYRIGHT: (C)2015,JPO&INPIT

LAMINATED ELECTRONIC COMPONENT

PROBLEM TO BE SOLVED: To provide a laminated electronic component in which a high withstand voltage can be obtained, even if a voltage is applied while a ceramic layer is thinned.SOLUTION: A laminated electronic component includes an electronic component body 1 where a ceramic layer 5 and an internal electrode layer 7 are laminated alternately. The ceramic layers 5 arranged to sandwich the internal electrode layer 7 vertically on both sides thereof are integrate with a ceramic binding material 9 partially penetrating the internal electrode layer 7. In the sectional view of the electronic component body 1, the internal electrode layers 7 are arranged not to overlap at the same position in the lamination direction, between the two layers arranged with the ceramic layer 5 interposed therebetween.COPYRIGHT: (C)2015,JPO&INPIT

METHOD OF MANUFACTURING MULTILAYER THIN FILM CAPACITOR

PROBLEM TO BE SOLVED: To provide a method of manufacturing a multilayer thin film capacitor which allows for increase in the capacity of a capacitor element, while enhancing the design flexibility in the structure of the capacitor element, and facilitating the capacity adjustment of the capacitor element.SOLUTION: Since the outer periphery of a capacitor element 6 is formed in a predetermined shape by a single etching, it is not required to ensure an alignment margin in an exposure mask used for processing the plan view of the outer periphery of a capacitor element 6 in the predetermined shape. Since the area of an electrode layer 4 can be increased, the capacity of the capacitor element 6 can be increased, and thereby the design flexibility in the structure of the capacitor element 6 can be enhanced. Furthermore, since the external dimensions of the capacitor element 6 can be adjusted by simply changing the design of the exposure mask used in the outline processing step, capacity adjustment of the capacitor element 6 can be facilitated.COPYRIGHT: (C)2015,JPO&INPIT

CAPACITOR ELEMENT

PROBLEM TO BE SOLVED: To solve the problems of flat formability inhibition, decrease in breakdown voltage characteristics, and operation sound during ripple current, by preventing occurrence of voids, wrinkles and distortion of a metalization film wound body in a capacitor element having ellipticity of 0.6 or more.SOLUTION: A composite film wound body 6 is configured by further winding an exterior film 5 on the outer periphery of a metalization film wound body 4 configured by winding a metalization film 3, and then winding and fixing by thermal welding. A flat columnar body 9 is configured by pressing the composite film wound body 6, and metal electrodes 10 are formed at both ends in the axial direction thereof. In a capacitor element having an oblateness of 0.6 or more from the point of view of volumetric efficiency up, the winding and fixing of the exterior film 5 is thermal welding at a part of self overlap, and performed at a plurality of points distributed in the circumferential direction, and the ratio of the entire outer peripheral surface occupied by the total thermal welding area is set to 30% or less.COPYRIGHT: (C)2015,JPO&INPIT

LAMINATED CERAMIC ELECTRONIC COMPONENT AND METHOD OF MANUFACTURING THE SAME

PROBLEM TO BE SOLVED: To provide a laminated ceramic electronic component and a method of manufacturing the same.SOLUTION: According to one embodiment of the present invention, the laminated ceramic electronic component can be provided which includes: a ceramic body including an internal electrode and a dielectric layer; an electrode layer formed on at least one surface of the ceramic body and electrically connected to the internal electrode; and a conductive resin layer formed on the electrode layer and containing a plurality of metal particles and a base resin. When the mass ratio of metal to carbon on a surface part of the conductive resin layer is A and the mass ratio of metal to carbon inside the conductive resin layer is B, A>B is satisfied.COPYRIGHT: (C)2015,JPO&INPIT

JIG FOR HEAT TREATMENT

PROBLEM TO BE SOLVED: To provide a jig for heat treatment capable of securing a passage of atmosphere gas and securing sufficient structural strength, with a simple configuration.SOLUTION: A jig for heat treatment 12 is used in heat treatment of chip-shaped electronic components. This jig includes: a mounting member which has a waving shape in which a mountain fold and valley fold are alternately repeated, is used for mounting the electronic components thereon, and has a plurality of through-holes smaller than a size of the electronic component; and reinforcement plates 123 as a pair of first reinforcement members which, when a traveling direction of waves in the waving form is defined as a first direction, and a horizontal direction orthogonal to the first direction is defined as a second direction, are provided in bottom parts or side parts at both ends in the second direction of the mounting member without being provided at both ends in the first direction of the mounting member.COPYRIGHT: (C)2015,JPO&INPIT

SOLID ELECTROLYTIC CAPACITOR FOR USE UNDER HIGH TEMPERATURE AND HIGH HUMIDITY CONDITION

PROBLEM TO BE SOLVED: To provide a solid electrolytic capacitor capable of exhibiting excellent electrical characteristics even under extreme conditions of high temperature and high humidity.SOLUTION: There is provided a solid electrolytic capacitor capable of exhibiting excellent electrical characteristics even under extreme conditions of high temperature and high humidity. The solid electrolytic capacitor includes a capacitor element including a sintered porous anode body, a dielectric that overlies the anode body, and a solid electrolyte that overlies the dielectric. The solid electrolyte contains a conductive polymer and an organometallic coupling agent. The capacitor also includes a moisture barrier layer that overlies the solid electrolyte and is formed from a hydrophobic elastomer which has a low surface energy so that it is not readily wettable by an aqueous medium.COPYRIGHT: (C)2015,JPO&INPIT

DYE-SENSITIZED SOLAR CELL, TANDEM DYE-SENSITIZED SOLAR CELL, AND COMPOSITE NANOSTRUCTURE

PROBLEM TO BE SOLVED: To provide a dye-sensitized solar cell including an anode layer of a nanostructure of a titanium oxide (TiO<SB>2</SB>) coated with a tin oxide (SnO<SB>2</SB>).SOLUTION: A dye-sensitized solar cell comprises: a substrate; an anode layer; a dye; and a cathode. The anode layer includes a TiO<SB>2</SB> nanostructure coated with SnO<SB>2</SB> whose coating thickness is in a range of 2-10 nm regardless of the form of the TiO<SB>2</SB> nanostructure. The TiO<SB>2</SB> nanostructure coated with SnO<SB>2</SB> comprises a shell composed of a dielectric layer whose thickness may be in a range of 0.3-2 nm. The dye overlies the anode layer. The cathode overlies the dye. The cathode has a counter electrode. The TiO<SB>2</SB> nanostructure may be a nano particle, a nano wire, or a nano tube of TiO<SB>2</SB>. When TiO<SB>2</SB> nanostructure is a nano wire or nano tube of TiO<SB>2</SB>, the central axis is perpendicular to the upper surface of the substrate.COPYRIGHT: (C)2015,JPO&INPIT

(54) DYE-SENSITIZED SOLAR CELL, TANDEM DYE-SENSITIZED SOLAR CELL, AND COMPOSITE NANOSTRUCTURE

(57) Abstract:

PROBLEM TO BE SOLVED: To provide a dye-sensitized solar cell including an anode layer of a nanostructure of a titanium oxide (TiO_2) coated with a tin oxide (SnO_2).

SOLUTION: A dye-sensitized solar cell comprises: a substrate; an anode layer; a dye; and a cathode. The anode layer includes a TiO_2 nanostructure coated with SnO_2 whose coating thickness is in a range of 2-10 nm regardless of the form of the TiO_2 nanostructure. The TiO_2 nanostructure coated with SnO_2 comprises a shell composed of a dielectric layer whose thickness may be in a range of 0.3-2 nm. The dye overlies the anode layer. The cathode overlies the dye. The cathode has a counter electrode. The TiO_2 nanostructure may be a nano particle, a nano wire, or a nano tube of TiO_2. When TiO_2 nanostructure is a nano wire or nano tube of TiO_2, the central axis is perpendicular to the upper surface of the substrate.

ELECTROCHEMICAL ENERGY STORAGE DEVICE WITH HIGH CAPACITY AND HIGH POWER USING CONDUCTIVE POLYMER COMPOSITE

PROBLEM TO BE SOLVED: To provide techniques simultaneously satisfying high capacity, high output and reduced internal resistance of an electrochemical device such as electric dual layer capacitors, super capacitors and pseudocapacitors.SOLUTION: An electrode of an electrochemical device contains conductive polymer particles, and inorganic nanoparticles having conductivity higher than the conductive polymer. The conductive inorganic nanoparticles are dispersed on surfaces of and/or inside the conductive polymer particles.COPYRIGHT: (C)2015,JPO&INPIT

THREE-TERMINAL TYPE CAPACITOR

PROBLEM TO BE SOLVED: To provide a three-terminal type capacitor capable of suppressing reduction in a capacitor function by suppressing cracks with respect to a conductive layer contributing electrostatic capacitance.SOLUTION: A three-terminal type capacitor includes a capacitor element 102. The capacitor element includes a second external electrode provided on one end and the other end in a length direction of a first surface, and a first external electrode provided between the two second external electrodes. The capacitor element includes: an inner layer dielectric layer 110 disposed between the first conductive layer 120 and the second conductive layer 122; two outermost conductive layers 124, 126 disposed so as to sandwich the inner layer dielectric layer; and an outer layer dielectric layer 112 disposed so as to sandwich the outermost conductive layer. One outermost conductive layer is connected to the first external electrode shared with the adjacent first conductive layer via the inner layer conductive layer, and the other outermost conductive layer is connected to the second external electrode shared with the adjacent second conductive layer via the inner layer conductive layer.COPYRIGHT: (C)2015,JPO&INPIT

CAPACITOR CLAMP ASSEMBLY

PROBLEM TO BE SOLVED: To configure a capacitor clam assembly so as to ease damage due to twisting and heat during operation.SOLUTION: A capacitor clam assembly 414 includes: a mounting base part 460; a center pole 462 projected from the base part 460 in a vertical direction and a plurality of outer peripheral side poles 464 arranged in a peripheral direction on the periphery of the center pole 462 so as to be projected from the base part 460 in the vertical direction. The combination of the center pole 462 and the plurality of outer peripheral side poles 464 demarcates a plurality of recess portions 436 located on the periphery of the center pole 462 in a peripheral direction in posture in the vertical direction to hold a plurality of corresponding capacitor elements 412 arranged vertically on a mounting surface, between the center pole 462 and the plurality of outer peripheral side poles 464. The capacitor elements 412 are a plurality of axial lead wire capacitor elements held by the assembly 414 so that first lead wires 430 are projected from the assembly 414 generally to the mounting surface and are exposed to a peripheral environment.COPYRIGHT: (C)2015,JPO&INPIT

INSTALLATION STRUCTURE OF FILM CAPACITOR

PROBLEM TO BE SOLVED: To provide a technology of preventing noise due to vibration of a capacitor from entering the inside of a vehicle.SOLUTION: In an installation structure of a capacitor 20, a plurality of capacitors 20 are housed in a capacitor case 30, with larger wound surfaces 20a of flat wound surfaces 20a, 20b, which are formed by winding a metal film in a flat shape, facing an opening 30a of the capacitor case 30. A potting material 50 charged between the capacitor case 30 and the capacitors 20 covers the opening 30a. The structure is mounted on an electric vehicle, with the opening 30a facing outward. A flat wound surface 20a which is likely to be vibrated faces the opening 30a of the capacitor case 30, thereby emitting noise due to the vibration to the outside of the capacitor case 30. The emitted noise is transmitted not inward but outward. The noise due to the vibration of the capacitor 20 is prevented from entering the inside of the vehicle, accordingly.COPYRIGHT: (C)2015,JPO&INPIT

INSULATING FILM FOR CAPACITOR TYPE STORAGE BATTERY

PROBLEM TO BE SOLVED: To provide a thin film capacitor type storage battery with high electrostatic capacity and excellent strength.SOLUTION: A capacitor type storage battery includes a substrate composed of a conductive film or a semiconductor film and an insulating film which are laminated in this order, and a first conducting path and a second conducting path that are formed in parallel with each other on the insulating film. Furthermore, a surface of the substrate with which the insulating film is in contact has projections and recesses with the maximum height of the projections of 10 μm and the maximum width of the projections of 10 μm. The projections are disposed with intervals for each other. The maximum width of the recesses disposed at the interval is 3 μm. The insulating film disposed to contact with the projections and recesses on the surface of the substrate comprises two or more layers including a first adhesive layer and a second adhesive layer. The first adhesive layer disposed adjacent to the first substrate is a layer closely adhered between the projections and recesses on the surface of the first substrate. The second adhesive layer disposed at a side nearer to the first and second conductive paths than the first adhesive layer is a layer for preventing the projections and recesses on the surface of the first substrate from contacting with the first and second conductive paths.COPYRIGHT: (C)2015,JPO&INPIT

(54) METHOD OF ASSEMBLING POWER CONDENSER

(57) Abstract:

The present invention relates to a method of assembling a power condenser. The present invention includes: a step of forming a pressed electrode drawing side by pressing the electrode drawing side of a wound condenser device by a press, a step of forming a first ultrasonic fusing part by performing a ultrasonic fusing process on a side of a lead plate and the electrode drawing side, a step of stacking multiple condenser elements having the first ultrasonic fusing part and combing them, a step of forming a second ultrasonic fusing part by performing a ultrasonic fusing process on a side of the lead plate for connection and the lead plate, and a step of folding the lead plate for connection.

FUSE BUILT-IN TYPE POWER CAPACITOR AND ASSEMBLING METHOD THEREOF

The present invention relates to a fuse built-in type power capacitor and an assembling method thereof. The fuse built-in type power capacitor can connect a connection plate and a wiring plate stably and reliably by using ultrasonic melting when connecting a lead plate and a capacitor element stacked on the inside of a fuse built-in type power capacitor. The fuse built-in type power capacitor of the present invention includes: multiple capacitor elements which have a first bending part and a second bending part formed on one side and the other side; multiple connection plates which are connected to the outside of the first bending part by ultrasonic melting; multiple fuses which are connected to the inside of the second bending part; multiple insulating boxes which surround the capacitor element to expose the other side of the connection plate and the other side of the fuse; and a first wiring plate which is arranged on the outside of the insulating box and is connected to the fuse by ultrasonic melting.

(54) FUSE BUILT-IN TYPE POWER CAPACITOR AND ASSEMBLING METHOD THEREOF

(57) Abstract:

The present invention relates to a fuse built-in type power capacitor and an assembling method thereof. The fuse built-in type power capacitor can connect a connection plate and a wiring plate stably and reliably by using ultrasonic melting when connecting a lead plate and a capacitor element stacked on the inside of a fuse built-in type power capacitor. The fuse built-in type power capacitor of the present invention includes: multiple capacitor elements which have a first bending part and a second bending part formed on one side and the other side; multiple connection plates which are connected to the outside of the first bending part by ultrasonic melting; multiple fuses which are connected to the inside of the second bending part; multiple insulating boxes which surround the capacitor element to expose the other side of the connection plate and the other side of the fuse; and a first wiring plate which is arranged on the outside of the insulating box and is connected to the fuse by ultrasonic melting.

ALUMINUM ELECTRODE FOIL AND MANUFACTURING METHOD THEREOF

The present invention relates to an aluminum electrode foil capable of reducing sintering time by forming a barrier-type sintering layer by sintering an etching pit part after a sponge-type etching pit part is formed on an etching foil having a straight-type etching pit, and a manufacturing method thereof. The present invention includes: an etching foil which has multiple straight-type etching pits at both sides; a sponge-type etching pit part which is formed along the straight-type etching pits; a barrier-type sintering layer which is formed by anodizing the sponge-type etching pit part; a hydration layer which is formed along the surface of the barrier-type sintering layer.

ALIGNING DEVICE AND METHOD FOR PRODUCING ELECTRONIC COMPONENT USING ALIGNING DEVICE

Provided is an aligning device capable of effectively aligning an object and preventing the generation of errors such as the breakage, leakage of the object or the like. In a first concave part (X1) of a first transfer tooth (10), the entire region of a second concave part (X2) viewing as a plane has a shape and dimension with a constant distance. In the first concave part (Y1) of a second transfer tooth (20), the entire region of the second concave part (Y2) has a shape and dimension with a constant distance. When the first and the second transfer tooth are overlapped with each other, in the Y1, the entire region of the X2 has a shape and a dimension with a constant distance. When an object (1) is moved in the cavity (X) of the first transfer tooth, the first transfer tooth and the second transfer tooth are overlapped with each other to move the object from a cavity (X) to a cavity (Y).

EMBEDDED MULTILAYER CERAMIC ELECTRONIC COMPONENT AND PRINT CIRCUIT BOARD HAVING EMBEDDED MULTILAYER CERAMIC ELECTRONIC COMPONENT

The present invention provides an embedded multilayer ceramic electronic component which comprises: a ceramic main body including a dielectric layer, and having first and second main surfaces facing each other, first and second lateral surfaces facing each other, and first and second cross sections facing each other; an active layer forming capacity by including a plurality of first and second internal electrodes formed to be exposed alternately through the both cross sections of the ceramic main body by placing the dielectric layer between the same; upper and lower cover layers formed in an upper part and a lower part of the active layer respectively; and first and second external electrodes formed at both end parts of the ceramic main body. The first external electrode includes a first base electrode and a first terminal electrode formed on the first base electrode, and the second external electrode includes a second base electrode and a second terminal electrode formed on the second base electrode. The outermost first internal electrode of the first and second internal electrodes is connected to the first base electrode by at least one first via extended to at least one of the first and second main surfaces of the ceramic main body, and the outermost second internal electrode is connected to the second base electrode by at least one second via extended to at least one of the first and second main surfaces of the ceramic main body.

SOLID ELECTROLYTIC CAPACITOR FOR USE UNDER HIGH TEMPERATURE AND HUMIDITY CONDITIONS

A solid electrolytic capacitor which is capable of exhibiting good electrical properties even under the extreme conditions of high temperature and humidity levels is provided. More particularly, the capacitor contains a capacitor element that includes a sintered porous anode body, a dielectric that overlies the anode body, and a solid electrolyte which overlies the dielectric. The solid electrolyte contains a conductive polymer and an organometallic coupling agent. The capacitor also contains a moisture barrier layer that overlies the solid electrolyte and is formed from a hydrophobic elastomer which has a low surface energy not to be readily wettable by an aqueous medium.

METHOD FOR PRODUCING ELECTRODE FOIL FOR ACCUMULATED TYPE ALUMINUM CAPACITOR HAVING PRELIMINARY PROCESS

The present invention relates to a method for producing an electrode foil for an accumulated type aluminum capacitor and, more specifically, to a method for producing electrode foil for an accumulated type aluminum capacitor which can overcome defect of a film occurring in an existing hydration step and troubles caused by fine pores, obtain stability of oxidized film, and reduce current leakage by performing preliminary process of accumulating an etched aluminum electrode foil in an acid electrolyte.

COMPOSITE ELECTRONIC COMPONENT AND BOARD FOR MOUNTING SAME

The present invention relates to a composite electronic component which comprises a composite having capacitor consisting of multiple dielectric layers and a ceramic body in which a first and second internal electrode arranged on both side of dielectric layers to face each other and an inductor consisting of a magnet body including a coil part; an input terminal formed on a first cross section of the composite, and connected to the coil part of the inductor; an output terminal including a first output terminal formed on the second cross section of the composite and connected to the coil part, and a second output terminal formed on the second cross section of the composite and connected to the first internal electrode of the capacitor; and a ground terminal formed on anyone or more among upper and lower surfaces and the first cross section of the capacitor in the composite, and connected to the second internal electrode of the capacitor, wherein the capacitor and the inductor is vertically combined, and a magnet sheet layer is inserted between the inductor and the capacitor.

MULTILAYER CERAMIC ELECTRONIC COMPONENT EMBEDDED IN SUBSTRATE AND PRINTED CIRCUIT BOARD WITH EMBEDDED MULTILAYER CERAMIC ELECTRONIC COMPONENT

One embodiment of the present invention provides a multilayer ceramic electronic component which includes: a ceramic body which includes a dielectric layer, first and second main sides which face each other in a thickness direction, first and second lateral sides which face each other in a width direction, first and second cross sections which face in a longitudinal direction, and a length of 1300um or less, a first external electrode which is extended to the first and second main sides and the first and second lateral sides on the first cross section, a second external electrode which is extended to the first and second main sides and the first and second lateral sides on the second cross section, a third external electrode which is arranged between the first external electrode and the second external electrode with preset intervals from the first external electrode and the second external electrode, a first internal electrode which is formed on the dielectric layer in the ceramic body and is connected to the first external electrode and the second external electrode, and a second internal electrode which is arranged to face the first internal electrode by interposing the dielectric layer and is connected to the third external electrode. When the thicknesses of the first external electrode, the second external electrode, and the third external electrode formed on the first and second main sides and the first and second lateral sides are te, and an interval between the adjacent external electrodes among the first to third external electrodes is G, 5<=G/te is satisfied.

ENERGY STORAGE DEVICE WITH IMPROVED FUNCTION OF PREVENTING SHORT CIRCUIT AND MANUFACTURING METHOD THEREOF

The present invention relates to an energy storage device. More particularly, the present invention relates to an energy storage device with improved function of preventing short circuit capable of preventing the possibility of electrical short due to bad assembly by forming a recess part in a combination member, and a manufacturing method thereof. More particularly, in the energy storage device of the present invention, an energy storage device with improved function of preventing short circuit includes: a harness which comprise a main body part having a bar shape of a preset length, a circuit terminal connection part formed on one end of the main body, and a ring-shaped cell terminal connection part which is formed at the opposite end of the main body to allow a cell terminal to be inserted through an internal hollow part; a cell terminal which is combined with the cell terminal connection part of the harness; a combination member which has a recess part which is formed in the outer surface of the combination part to prevent electric short generated due to the bad assembly of the combination member.

CAPACITOR MODULE CONNECTED IN SERIES AND METHOD FOR FABRICATING SAME

The present invention relates to a capacitor module connected in series fabricated by connecting two capacitors in series. The purpose of the present invention is to provide a capacitor module connected in series capable of connecting two capacitors in series by a simple process. A capacitor module connected in series according to the present invention includes: a first capacitor which has a first cathode terminal and a first anode terminal, a second capacitor which has a second cathode terminal and a second anode terminal, a plate-shaped connection plate which is connected to one of the first cathode terminal and the second anode thermal and the first anode thermal and the second cathode terminal, and a case which is inserted into the first capacitor, the second capacitor, and the connection plate.

MANUFACTURING METHOD OF SINGLE ELECTRODE INTEGRATED ION GEL ELECTROLYTE

The present invention relates to a manufacturing method of single electrode integrated ion gel electrolyte, and more specifically, to a manufacturing method of single electrode integrated ion gel electrolyte, by which, by placing one electrode in the inside of a formation space of a Teflon frame and applying a material solution thereon, electrode integrated ion gel electrolyte is produced, so that the ion gel electrolyte is formed with the most thin thickness to improve the performance of an electrical double layer capacitor. The present invention is to form the electrical double layer capacitor, and the manufacturing method of the single electrode integrated ion gel electrolyte disposed between a first electrode and a second electrode, comprises the steps of: creating a composite solution through a defoamation after ionic liquid reacts with a high molecular substance by a mixing and stirring; forming a material solution by removing water of the composite solution through artificial drying under vacuum; fixing the first electrode in the Teflon frame so that the first electrode is included in the inside of the formation space penetrated in the Teflon frame; applying the material solution to the formation space of the Teflon frame; heat-processing upper and lower parts of the Teflon frame after the parts are fixed using a pressure member; and removing a form of ion gel electrolyte integrated with the first electrode after natural drying of the Teflon frame.

MULTI-LAYERED CERAMIC CAPACITOR

The present invention provides a multi-layered ceramic capacitor which comprises: a ceramic body in which a plurality of dielectric layers are layered in a widthwise direction, wherein the ceramic body has first and second circumferential faces in a thickness direction of facing each other, first and second sections in a longitudinal direction, and first and second sides in the widthwise direction; a plurality of first and second internal electrodes disposed to be alternately exposed through the first and second sections of the ceramic body around the dielectric layers; a plurality of first dummy electrodes formed to be exposed through the first circumferential face and the first section of the ceramic body on the dielectric layer; a plurality of second dummy electrodes formed to be exposed through the first circumferential face and the second section of the ceramic body on the dielectric layer; first and second external electrodes formed on the first and second sections of the ceramic body; first and second plating layers formed on the first and second external electrodes; and first and second terminal electrodes formed to be respectively connected to the first and second plating layers in an area in which the first and second dummy electrodes are exposed in the first circumferential face. The first and second eternal electrodes comprise an inner external electrode layer not in contact with the first and second dummy electrodes, and an outer external electrode layer in contact with the first and second dummy electrodes.

COMPOSITE SHEET, MULTILAYER CERAMIC ELECTRONIC COMPONENT, AND METHOD FOR MANUFACTURING THE MULTILAYER CERAMIC ELECTRONIC COMPONENT

The invention relates to a composite sheet, a multilayer ceramic electronic component, and a method for manufacturing the multilayer ceramic electronic component. A composite sheet improving sealing connection performance between a conductor film and a ceramic green sheet and capable of eliminating stacked deviation is provided. The composite sheet (11) includes the ceramic green sheet (13) having a lengthwise direction and the conductor film (14) printed on the ceramic green sheet (13). The conductor film (14) has a shape that has a longitudinal dimension extending in the lengthwise direction and a lateral dimension perpendicular or substantially perpendicular to the longitudinal direction. The conductor film (14) includes a plurality of thickness-varied regions (14b) arranged in a row or a plurality of rows extending in the lengthwise direction while being dispersed in the lengthwise direction. The thickness-varied regions (14b) have a thickness that is different from a thickness of a portion of the conductor film excluding the thickness-varied regions (14a).

CONDUCTIVE PASTE COMPOSITION FOR EXTERNAL ELECTRODE, MULTILAYER CERAMIC ELECTRONIC COMPONENT USING THE SAME, AND MANUFACTURING METHOD THEREOF

The invention provides a conductive paste composition of an external electrode, wherein the composition comprises copper powder and copper oxide powder. The invention further provides a conductive paste composition for an external electrode, and a manufacturing method thereof. And more specifically, the invention provides a conductive paste composition for an external electrode, allowing for decreased blister and glass beading defects by improving a removal of residual carbon at low temperature before necking between metal particles is generated and the metal particles are densified during a firing process of the external electrode, a multilayer ceramic electronic component using the conductive paste composition, and a manufacturing method thereof.

Dye-sensitized solar cell photo-anode producing method

The invention relates to a dye-sensitized solar cell photo-anode producing method. The dye-sensitized solar cell photo-anode producing method mainly comprises the steps of dipping an anode base body of a dye-sensitized solar cell in a mixture formed by a photo-sensitive dye and an organic solvent under the ultrasound condition, taking the anode base body absorbed with the photo-sensitive dye, and performing washing and drying to obtain a target product. The technical problem that the dye-sensitized solar cell in the prior art is long in manufacture time and the dye is unevenly absorbed on the anode base body is solved by means of the dye-sensitized solar cell photo-anode producing method, and the dye-sensitized solar cell photo-anode producing method has commercial prospect.

Production method of low voltage aluminum anode foil for electrolytic condenser

The invention discloses a production method of a low voltage aluminum anode foil for an electrolytic condenser. The production method including the steps of: 1, adding aluminum foil into ammonium adipate solution for formation treatment; 2, performing secondary formation treatment; 3, performing third formation treatment; 4, performing fourth formation treatment; 5, performing fifth formation treatment; 6, performing sixth formation treatment; 7, performing depolarization treatment; 8, performing primary repair formation treatment; 9, performing secondary repair formation treatment; 10, performing aftertreatment; 11, performing thermal treatment: including putting the aluminum foil which is subjected to aftertreatment into a roasting furnace for roasting, then putting the roasted aluminum foil into a drying furnace for drying, and thereby the product is obtained. The aluminum foil manufactured according to the production method provided by the invention is improved in anti-hydration and wet-resistance of the oxide film.

Chip high-voltage miniature long-life aluminum electrolytic capacitor and manufacturing method thereof

The invention belongs to the technical field of chip aluminum electrolytic capacitors and particularly relates to a chip high-voltage miniature long-life aluminum electrolytic capacitor and a manufacturing method thereof. The chip high-voltage miniature long-life aluminum electrolytic capacitor comprises outer electrolytic paper, a positive guide pin, anode foil, a negative guide pin, cathode foil and inner electrolytic paper. The positive guide pin is riveted on the anode foil and the negative guide pin is riveted on the cathode foil. The outer electrolytic paper, the anode foil, the inner electrolytic paper and the cathode foil are wound together into a core package. The riveted portions between the positive guide pin and the anode foil as well as between the negative guide pin and the cathode foil are respectively provided with a hydrophilic high temperature electrically conductive adhesive tape. The anode foil is an anode foil of high voltage withstanding and high specific volume and the cathode foil is a forming cathode foil. The inner electrolytic paper and the outer electrolytic paper are electrolytic paper of low tightness and low thickness. The chip high-voltage miniature long-life aluminum electrolytic capacitor has the advantages of being provided with one hydrophilic high temperature electrically conductive adhesive tape at the riveted portions between the positive guide pin and the anode foil as well as between the negative guide pin and the cathode foil respectively for significantly reducing the size of the core package and increasing the contact area for further achieving the characteristics of miniaturization and high temperature wave resistance of the product.

Composite film material with electrochemical activity and preparation method thereof

The invention discloses a composite film material with electrochemical activity and a preparation method thereof, and belongs to the field of preparation of the composite material. The composite film is formed by alternately self-assembling an amphiphilic ruthenium complex molecular film, a symmetric ruthenium complex molecular film and graphene; the substrate is ITO (Indium Tin Oxide), wherein the amphiphilic ruthenium complex is [Ru(Py2G1MeBip)(XPOH)](PF6)2, and the symmetric ruthenium complex is [Ru(XPOH)2](PF6)2. The obtained composite film is uniformly and fully modified on a conductive substrate, has good mechanical and chemical stability and combines the respective advantages of three materials, the electrochemical performance and stability are obviously improved compared with a single self-assembled thin film. The operation can be performed by using a simple container at room temperature without special conditions or complex expensive equipment; compared with other layer-by-layer assembly technologies, the material and the preparation method have the advantages of easiness and convenience in operation, short assembly time, no influence by the material and the shape of the substrate, high bonding strength of the composite film and the substrate and higher popularization and application value.

Application of 3D coralline graphene/NiCo2O4 composite material

The invention belongs to the chemistry field and provides a preparation method of 3D coralline graphene/NiCo2O4 composite material and application thereof in supercapacitor; the method comprises the following steps: 1) compositing the graphite oxide GO; 2) adding the Ni-Co salt and alkali source in the suspension liquid of the graphite oxide, microwave heating for preparing the GO/Ni-Co lamelleted bi-metal hydroxide composite material; 3) calcining the GO/Ni-Co lamelleted bi-metal hydroxide composite material at high temperature for preparing the 3D coralline graphene/NiCo2O4 composite material; 4) preparing the electrode plate and assembling the simulation supercapacitor for evaluating the performance. Compared with the prior art, the 3D coralline graphene/NiCo2O4 composite material has superior electrical conductivity, greater specific surface area, smaller mass transfer resistance and longer cycle service life. In addition, the 3D coralline graphene/NiCo2O4 composite material is used in the electrode material of the supercapacitor, the the 3D coralline graphene/NiCo2O4 composite material is superior to the existing rare metallic oxide on the cost and performance.

Nickel-cobalt sulpho-spinel for super capacitor and preparation method of nickel-cobalt sulpho-spinel

The invention discloses a nickel-cobalt sulpho-spinel for super capacitor and a preparation method of the nickel-cobalt sulpho-spinel and aims to further improve the pseudocapacitance feature of nickel-cobalt metal compound composite material and increase the specific discharge capacity and cycling stability of the nickel-cobalt metal compound composite material. The preparation method includes: nickel salt, cobalt salt and penicillamine are used as raw materials, a solvent-thermal method is used, precursor nickel salt, cobalt salt and penicillamine proportion, solvent varieties, solvent-thermal temperature/time, pH values and the varieties of used inorganic acids are controlled, and subsequent procedures of centrifuging/washing/drying/roasting and the like are performed to obtain the nickel-cobalt sulpho-spinel nano material. Tests show that when the nickel-cobalt sulpho-spinel nano material is used as electrode material to produce a super capacitor, high specific discharge capacity and cycling stability are achieved. In addition, the preparation method is low in reaction temperature, controllable in reaction, capable of satisfying the requirements of industrial production, suitable for large-batch production and promising in development prospect.

Coaxial nanometer wire with porous graphene/MnO2 pipe and middle line structure, preparation method and application thereof

The invention relates to a coaxial nanometer wire with a porous graphene/MnO2 pipe and a middle line structure, a preparation method of the coaxial nanometer wire and an application of the coaxial nanometer wire. The material can be regarded as a positive-electrode active material of an electrochemical super-capacitor. The material is formed by cladding a MnO2 nanometer wire with a porous graphene pipe, the length is 10-40 micrometers and the diameter is 40-160 micrometers, wherein the diameter of the MnO2 nanometer wire is 30-80 micrometers, and the porous graphene pipe is formed by curling a graphene sheet and provided with different-extent mesoporous structures. The coaxial nanometer wire is relatively high in specific capacity, and excellent in cyclic performance and steadiness and electrochemical performance under high current charge-discharge conditions; secondly, the coaxial nanometer wire is simple in process, after simple hydro-thermal treatment is performed, the coaxial nanometer wire material with the middle line structure and the porous graphene/MnO2 pipe is low in power consumption. The mass of the used graphene only accounts for 2.2% of the total mass, thus the coaxial nanometer wire material is good for marketization and popularization.

Method for assembling capacitor with graphene nanosheets

The invention discloses a method for assembling a capacitor with graphene nanosheets. The method comprises the following steps: flake graphite is oxidized and dried; graphene nanosheets are prepared through thermal exfoliation under the conditions of low temperature and atmospheric pressure; and grapheme, conductive carbon black and PTFE emulsion with a mass fraction of 50% are mixed at a mass ratio of 80: 8: 5, absolute ethyl alcohol is added to the mixture and the mixture is stirred, the mixture is heated to break the emulsion, drying is carried out at the temperature of 50 DEG C to prepare electrode sheets, and the dried electrode sheets are assembled into a capacitor by adopting a special diaphragm for capacitors and using 6mol/L KOH solution as electrolyte. The ratio of grapheme, conductive carbon black and binder is reasonable, and the prepared capacitor has good performance and large specific capacitance.

Oblique photoetching method capable of increasing specific surface area of MEMS super-capacitor electrode

The invention discloses an oblique photoetching method capable of increasing the specific surface area of an MEMS super-capacitor electrode. The oblique photoetching method capable of increasing the specific surface area of the MEMS super-capacitor electrode includes steps that firstly, spinning photoresist with a certain thickness on a clean and dry silicon substrate, fixing a silicon wafer spun with the photoresist on a specially designed cast steel frame which inclines by 15 degrees, exposing the photoresist on the silicon wafer for two times, to be specific, rotating the silicon wafer in the plane thereof by 180 degrees to perform the second exposure after finishing the first exposure, finishing the exposure process of the oblique photoetching after ending the two times of exposure, developing to form an X type three-dimensional electrode array structure, and preparing a three-dimensional micro-electrode. The oblique photoetching method capable of increasing the specific surface area of the MEMS super-capacitor electrode improves the specific surface area of the three-dimensional array structure through improving the exposure mode from the design technique perspective, compared with a traditional vertical electrode array structure, the X type array is featured with high depth-to-width ratio, large specific surface area, stable structure and the like. The structure can be broadly used for the MEMS super-capacitor electrode structure design.

Multilayer ceramic capacitor impregnation wax and preparation method thereof

The invention discloses a multilayer ceramic capacitor impregnation wax and a preparation method thereof. The multilayer ceramic capacitor impregnation wax comprises, by weight, 60-85% of microcrystalline wax, 5-15% of butane polymer, 5-15% of polypropylene wax, 2-10% of insulation oil, and 0.1-1.0% of antioxidant. The impregnation wax of the invention has the characteristics of good insulation performance, moisture resistance, heat resistance and adhesion, suitable physical and chemical properties, good using performance, non-toxicity, no pollution, and environment-friendliness. The impregnation wax of the invention is applicable to impregnation of multilayer ceramic capacitors.

Capacitor

The invention relates to the technical field of a ceramic capacitor and especially relates to a cylindrical stacked ceramic capacitor. The capacitor comprises a cylindrical ceramic body, a first lead, a second lead, a first pole plate group and a second pole plate group, wherein the first lead is welded with the first pole plate group; the second lead is welded with the second pole plate group; the ceramic body is formed by sintering an LTCC (Low Temperature Co-Fired Ceramic) ceramic material added with CaO-R2O-ZrO2 base of Al2O3 at high temperature, so that the dielectric loss of the capacitor is reduced and the anti-bending strength is relatively high; meanwhile the anti-bending strength and the high-pressure resistance breakdown strength are further increased through the first and second pole plate groups of the multi-layer embedded cylindrical structure.

Belt heat treatment producing technology for solid electrolyte aluminum electrolytic capacitor

The invention discloses a belt heat treatment producing technology for solid electrolyte aluminum electrolytic capacitor, a positive electrode guide pin is riveted on an anode foil, a negative electrode guide pin is riveted on a cathode foil; a winding machine is used for winding more cathode foil; the cathode foil covers the whole core bag and the high temperature adhesive tape is used for surrounding, clinging and fixing; the glue cover for sealing action is mounted on the core bag; the core bag is soaked in the formation liquid for repairing operation and taken out and absorbed with the redundant water; the processed core bag is processed on carbonization treatment; the soaking treatment and carbonization treatment for the core bag are repeated; the core bag is soaked in the formation liquid for repairing operation and cleaned in the deionized water after the formation treatment, the specific resistance of the water is greater than 2M; the monomer is soaked in the oxidizing agent, polymerized, thermal treated and packed in the aluminum shell, the opening is sealed and the aging treatment is executed for forming the finished product. After polymerizing the core bag, the high temperature treatment is executed, a abundant of impurity is volatilized for hydrolyzing and producing the sulfonic acid, the oxidation film of the core bag is broken, the whole capacitor is corroded and the service life is reduced.

Processing technology of aluminum electrolytic capacitor for solid electrolytes

The invention discloses a processing technology of an aluminum electrolytic capacitor for solid electrolytes. The processing technology includes the steps of: riveting a positive guide pin on an anode foil, and riveting a negative guide pin on a cathode foil; coiling by a coiler, coiling more cathode foil to cover the whole core cladding, and then winding with a high-temperature resistant tape for clinging and fixing; installing a rubber cover for sealing on the core cladding; steeping the core cladding into forming agent for repairing, taking out and then soaking up redundant moisture; performing carbonization treatment on the repaired core cladding; repeating the steps of steeping the core cladding and carbonizing; further steeping the core cladding into the forming agent for repairing, after formation putting into deionized water for cleaning, wherein the electrical resistivity of the water is more than 2M; impregnating by monomer oxidizing agent; after impregnation, polymerizing, thermally processing, finally packaging into an aluminum shell, sealing, aging, and thereby obtaining the finished product. According to the unique impregnating method and technical parameters in impregnation provided by the invention, the produced solid capacitor is stable in quality and low in rejection rate.

Method for producing solid aluminum electrolytic capacitor in use of asymmetric electrolytic paper core cladding

A method for producing a solid aluminum electrolytic capacitor in use of asymmetric electrolytic paper core cladding comprises the steps: clamping electrolytic paper between two guide pins, wherein the electrolytic paper is wider than an electrode foil; two parts, exceeding the electrode foil, at two edges coiled with the electrolytic paper are not the same; the part, exceeding the foil, at one end close to a CP line is more than the other part; and the exceeding part arrives at the joint of the round bars of the guide pins and a flat plate; covering the joint of the round bars of the guide pins and the flat plate in use of the electrolytic paper; and then obtaining the solid aluminum electrolytic capacitor after conventional carbonization, impregnation and polymerization. In the produced solid aluminum electrolytic capacitor, the electrolytic paper covers the junction of the round bars of the guide pins and the flat plate; during the formation of the core cladding, becuase the electrolytic paper is fully absorbed with the electrolyte, the electrolytic paper is clung to the round bars and the flat plate, the gas absorption is damaged and the gas separation to the formed liquid and an aluminum body is avoided or weakened; the junction of the round bars and the flat plate is formed better and the pellumina layer on the surface is covered better.

Ruthenium complex monomolecular film and method for preparing monomolecular film by self-assembling ruthenium complex on graphene

The invention relates to a ruthenium complex monomolecular film and method for preparing the monomolecular film by self-assembling a ruthenium complex on graphene, and belongs to the technical field of molecular self-assembling chemicals. The ruthenium complex monomolecular film is directionally self-assembled on graphene, and pyrenyl in the ruthenium complex of the ruthenium complex monomolecular film interacts with graphene with pi-electronic environment through pi-pi to fix two pyrenyl of ruthenium complex molecule on a graphene interface. The method comprises the steps of preparing a ruthenium complex solution; preparing graphene dispersing liquid; fixing a preprocessed ITO substrate on a rotary coating instrument; uniformly paving the prepared graphene dispersing liquid on the substrate to form a film for preparing a graphene base; directionally assembling the ruthenium complex on the graphene base to prepare the monomolecular film. The film prepared by the method has the advantages of being high in mechanical and chemical stability, and controllable to thickness.

Self-supported titanium nitride/graphene combined electrode and preparation method thereof

The invention relates to a self-supported titanium nitride/graphene combined electrode and a preparation method of the self-supported titanium nitride/graphene combined electrode. The preparation method comprises the steps that (1) titanium foil is soaked with acid liquid, ultrasonic processing is conducted on the titanium foil, the titanium foil is taken out, washed by deionized water, and soaked with a hydrogen peroxide solution, the temperature of the solution is increased to 60DEG C-95DEG C from the room temperature under the normal pressure through heating, the temperature is kept for 10-60 minutes, and the titanium foil is taken out and dried after an reaction ends; (2) the titanium foil is placed into a tubular atmosphere furnace, ammonia is fed into the tubular atmosphere furnace to conduct nitrogen treatment on the titanium foil, and titanium nitride is formed on the surface of the titanium foil; (3) a layer of graphene is formed on the surface of the titanium nitride in a deposition mode through a dipping-pull method or a drop casting method, and the graphene and the titanium nitride are placed into a drying oven at the temperature ranging from 60DEG C to 100DEG C to be dried, so that the self-supported titanium nitride/graphene combined electrode is obtained. Compared with the prior art, a graphene/titanium nitride three-dimensional network is directly formed on the surface of flexible metal foil so that the self-supported electrode can be formed. The combined electrode is low in cost, high in porosity ratio and good in catalytic activity and electrical conductivity, and has the broad application prospect.

Method for improving hole production performance of aluminum foil through additional annealing treatment

The invention discloses a method for improving the hole production performance of aluminum foil through additional annealing treatment. The aluminum foil after pretreatment is placed in an annealing furnace for three stages of treatment of heating, heat preservation and cooling. The method is characterized in that the heating rate is 3 to 5 DEG C every minute; the number of heat preservation periods is two to three, the heat preservation temperature is 300 to 520 DEG C, and the heat preservation time is 1 to 6 hours; the cooling rate is 5 to 8 DEG C every minute and the subsequent treatment is performed after the cooling to obtain the corrosion foil; a specific volume value of the corrosion foil is improved by 10 to 15% under the condition that the bending and booster value performance of the aluminum foil after the treatment is unchanged. According to the method for improving the hole production performance of the aluminum foil through the additional annealing treatment, the distribution of trace elements on the surface of the aluminum foil is improved through annealing to improve the corrosion hole production performance of the surface of the aluminum foil so as to improve the specific volume of the aluminum foil and the simple and efficient effect is achieved.

Disk gyro spiral wing quantum chromodynamics power generation engine automobile with magnetic chord radio-frequency quantum chromodynamics super power amplifying capacitor and super power amplifying transformer

The invention provides a disk gyro spiral wing quantum chromodynamics power generation engine automobile with magnetic chord radio-frequency quantum chromodynamics super power amplifying capacitor and super power amplifying transformer and relates to the environment-friendly recyclable new energy of magnetic chord radio-frequency quantum chromodynamics field-effect vortex fusion super power amplifiers. The following five original inventions are included: 1, a disk super power amplifying capacitor, 2, tri-prism disk super power amplifying sensing driver and transformer, 3, a disk super power amplifying generator motor automobile, 4, a disk gyro spiral wing chromodynamics super power amplifying generator motor automobile, and 5, a disk gyro spiral wing chromodynamics super power amplifying chain effect generation field. The electromagnetic energy conversion power amplification power is high. The three functions of power amplification, power generation and starting are environment-friendly and pollution-free, and the disk Tai chi pili vortex fusion super power amplifying effect is achieved by exciting the magnetic chord radio-frequency quantum chromodynamics field-effect vortex fusion energy by virtue of the synchronous coupling and polarization of sine wave power and sine wave magnetism. The super power amplifying transformer is used for driving the disk gyro spiral wing super power amplifying generator motor to realize the environment-friendly new energy source and automobile industries; besides, the scaffold is uniformly applied in quantum chromodynamics electromagnetic super power amplification to lay the industrial base of the quantum chromodynamics super power amplifying dynamic electromagnetism of wave chord Tai chi study.

Electrode material, preparation method and application thereof, and super-capacitor

The invention discloses an electrode material, a preparation method of the electrode material, an application of the electrode material, and a super-capacitor. The electrode material comprises A components and B components, wherein the A components comprise a poly(vinylidene fluoride) polymer and an additive; the additive is alkali metal salt and/or alkaline substance; the B components are conducting polymers. But above all, the poly(vinylidene fluoride) polymer provides space to transmit conducting particles except for the adhesive effect of the traditional electrode material. Under alkali metal salt and/or alkaline substance, activated carbon can be generated in the poly(vinylidene fluoride) polymer, and then the electrode material has the charge transportation ability, thus the performance breakage caused by changing the volume of the conducting polymer can be reduced in discharging and charging processes. Besides the conducting polymer in the electrode material is regarded as an conductive body ingredient, and integration between the conducting polymer and the poly(vinylidene fluoride) polymer is relatively high, so that the contact resistance between the conducting polymer and the poly(vinylidene fluoride) polymer is relatively low.

ALL SOLID-STATE ELECTROCHEMICAL DOUBLE LAYER SUPERCAPACITOR

The present invention provides a power system for a vehicle The power system comprising a supercapacitor-like electronic battery that is connected to a battery charger. The battery charger provides energy to the supercapacitor-like electronic battery. A heater is operatively connected to the supercapacitor-like electronic battery to provide energy to heat the supercapacitor-like electronic battery thereby lowering the internal impedance of the supercapacitor-like electronic battery. A charging apparatus is operatively connected to the battery charger. A motor is operatively connected to the vehicle and the supercapacitor-like electronic battery. A feedback loop controller is operatively connected to the heater, the supercapacitor-like electronic battery and the motor.

Preparation method for 3D coralloid grapheme/NiCo2O4 composite materials

The invention belongs to the field of chemistry and provides a preparation method for 3D coralloid grapheme/NiCo2O4 composite materials. The method comprises 1) synthesizing graphite oxide GO; 2) adding nickel and cobalt salt and an alkali source into a GO suspension, and performing microwave heating to assist to prepare GO/nickel and cobalt layer double-metal-hydroxide composite materials; 3)performing high-temperature calcinations on the prepared GO/nickel and cobalt layer double-metal-hydroxide composite materials to prepare the 3D coralloid grapheme/NiCo2O4 composite materials; 4) preparing electrode sheets and assembling a simulation super capacitor to evaluate the performance. Compared with the prior art, the composite materials have the advantages that the electrical conductivity is outstanding, the specific area is large, the mass transfer resistance is small, and the cycle life is long; besides, the composited 3D coralloid grapheme/NiCo2O4 composite materials are applied as electrode materials of super capacitors, and the cost and the performance of the composite materials are better than those of prior precious metal oxides.

Graphene-ruthenium oxide composite material preparation method

The invention relates to a graphene-ruthenium oxide composite material preparation method and belongs to the technical field of supercapacitor electrode material preparation. According to the implementation scheme, the method includes the steps of uniformly mixing graphene oxide dispersion liquid with liquid containing a ruthenium precursor, adjusting the pH to 5-8, and performing hydrothermal reaction at the temperature of 150 DEG C-250 DEG C; performing solid-liquid separation to obtain a black solid after the hydrothermal reaction, and washing, drying and annealing the black solid to obtain a finished product; or uniformly mixing graphene oxide dispersion liquid with liquid containing a ruthenium precursor, and performing hydrothermal reaction at the temperature of 150 DEG C-250 DEG C; performing solid-liquid separation to obtain a black solid after the hydrothermal reaction, and washing, drying and annealing the black solid to obtain a finished product. The graphene-ruthenium oxide composite material preparation method is simple in process and has the advantages of environment friendliness, energy saving and the like. The obtained product is high in combined performance, low in cost and suitable for industrial application.

Laminated ceramic capacitor

[Problem] To provide a laminated ceramic capacitor with an insulation resistance unsusceptible to degradation. [Solution] A laminated ceramic capacitor (10) is composed of a total of 19 unit capacitors (UC1 to UC19) arranged in the lamination direction, each of which has an electrostatic capacitance distributed so that the electrostatic capacitance at the center in the lamination direction is smaller than the electrostatic capacitance on both sides in the lamination direction, when a unit capacitor is defined as a section constituted by two internal electrode layers (12) adjacent to each other in the lamination direction and a single dielectric layer (13) interposed between the two internal electrode layers (12).

Method for manufacturing electrode for aluminum electrolytic capacitor

A porous aluminum electrode (10) has a porous layer (30) formed by sintering aluminum powder on the surface of an aluminum core (20). The porous aluminum electrode (10), when subjected to a chemical conversion to a voltage of 200V or more, is boiled and then subjected to a first chemical conversion process in which chemical conversion is performed in an aqueous solution of ammonium adipate at a temperature of 80 DEG C or below and a second chemical conversion process in which chemical conversion is performed in a boric acid aqueous solution. When heat depolarization is first carried out, washing with water is performed for five minutes or more before heat depolarization; therefore, the porous layer (30) is not destroyed.

Lithium ion capacitor

Provided is a lithium ion capacitor that is safe and has a high energy density and a high output. Specifically provided is a lithium ion capacitor comprising, accommodated within an outer casing: an electrode stack obtained by stacking a negative electrode in which a negative-electrode active material layer including a carbon material as the negative-electrode active material is disposed on a negative-electrode collector, a separator comprising a polyethylene-containing polyolefin resin, and a positive electrode in which a positive-electrode active material layer including a positive-electrode active material layer comprising a carbon material or a carbonaceous material is disposed on a positive-electrode collector; and a non-aqueous electrolyte solution including a lithium ion-containing electrolyte. The lithium ion capacitor is characterized in that the thermal contraction/expansion rate of the separator falls within a prescribed range, the surface area of the separator is greater than the surface area of the positive-electrode active material layer of the positive electrode or the surface area of the negative-electrode active material layer of the negative electrode, and the length of a section where the electrode surface and the separator do not overlap has a prescribed relationship to the size of the separator.

Water cooling heat dissipation capacitor

The invention discloses a heat dissipation capacitor which comprises a body, a top cover and an inner cavity. A metal layer is fixedly arranged outside the body; the metal layer is in sealing connection with the body; a water accommodating cavity is formed between the metal layer and the body; a heat conduction resistance separator is arranged in the water accommodating cavity; the heat conduction resistance separator separates the water accommodating cavity into an inner layer cavity and an outer layer cavity; the heat conduction resistance separator is fixed on the body by a joint pin; both the upper ends and the lower ends of the inner layer cavity and the outer layer cavity are communicated; moreover, a plurality of heat dissipation grooves are uniformly distributed on the periphery of the metal layer. The heat dissipation capacitor has a simple structure; by arranging the heat conduction resistance separator between the body and the metal layer, self-circulation of cooling water can be realized between the inner layer cavity and the outer layer cavity so as to effectively carry out heat dissipation; the heat dissipation capacitor does not need to be driven by an external power, so that cost resources are greatly saved; meanwhile, the formed heat dissipation grooves improve a cooling rate of the metal layer, so that a heat dissipation rate is further improved.

Method for preparing dielectric film for vacuum capacitive transducer

The invention discloses a method for preparing a dielectric film for a vacuum capacitive transducer. The vacuum capacitive transducer is an important component of a magnetic tape unit for a graphic transmitter and prone to damages of the dielectric film. A damaged old film can be replaced by a new film made by steps of selection of the dielectric film, etching of a red film, evaporation of aluminum, photoetching of pole plates, mounting, adjustment and the like. The method for preparing the dielectric film for the vacuum capacitive transducer is simple and low in cost, only about ten yuan is taken for preparing the dielectric film, and the new film is excellent in abrasion resistance and convenient to mount.

Solid electrolytic capacitor packaging structure and manufacturing method thereof, and conductive unit

The invention discloses a solid electrolytic capacitor packaging structure and a manufacturing method thereof, and a conductive unit. The solid electrolytic capacitor packaging structure comprises a capacitor unit, a packaging unit, and a conductive unit. The packaging unit comprises a packaging body used for coating the capacitor unit. The conductive unit comprises a first conductive terminal and a second conductive terminal. The first conductive terminal comprises a first core layer and a first coating layer. The first core layer has a first exposed upper surface exposed from the first coating layer, and the first exposed upper surface has a first upper covered area covered by the packaging body. The second conductive terminal comprises a second core layer and a second coating layer. The second core layer has a second exposed upper surface exposed from the second coating layer, and the second exposed upper surface has a second upper covered area covered by the packaging body. Thus, the air tightness between the contact surfaces of the conductive terminals and the packaging body can be improved.

Solid electrolyte aluminum electrolytic capacitor and manufacturing method thereof

The invention discloses a solid electrolyte aluminum electrolytic capacitor which comprises an aluminum casing and a core cladding arranged in the aluminum casing, wherein the core cladding comprises an anode formed aluminum foil, a cathode foil, electrolytic paper between the anode formed aluminum foil and the cathode foil as well as solid electrolyte, wherein the solid electrolyte is formed by heating and polymerizing a monomer, an oxidant and a conducting material; a compound carbon material with higher conducting performance is led in the polymer, so that excellent ESR (Equivalent Series Resistance) of the solid electrolyte aluminum electrolytic capacitor can be obtained. The invention also discloses a manufacturing method for the solid electrolyte aluminum electrolytic capacitor. According to the manufacturing method, a lower ESR value can be obtained.

Method of using spraying method to manufacture dye-sensitized solar cell photo-anodes

The invention belongs to the research field of dye-sensitized solar cell photo-anodes and particularly relates to a method of using a spraying method to manufacture the dye-sensitized solar cell photo-anodes. Slurry for spraying is firstly manufactured, the multi-hole layer and scattering layer slurry is manufactured and sprayed on an FTO conducting glass substrate, and drying under a room temperature and heat treatment are conducted. The slurry raw materials for the photo-anode spraying are easy to obtain, low in cost, simple in manufacturing method and good in dispersity and stability, the thin film manufactured by spraying is good in evenness, the combining force between the thin film and the FTO glass substrate is good, the thickness is good in controllability, and the method is good for industrialized development of dye-sensitized solar cells.

Micro super capacitor nano-device based on porous graphene-supported polyaniline heterostructure and manufacturing method thereof

The invention relates to a micro super capacitor nano-device based on a porous-graphene-supported polyaniline heterostructure and a manufacturing method thereof. A symmetrical fork electrode structure is formed on a substrate material; forks are 100-200 nanometers in widths; the distances among the forks are 50-100 nanometers; electrolyte is added dropwise; in the fork electrode structure, gold serving as a current collector is taken as the first layer of an electrode material; porous graphene is attached to the gold and is taken as the second layer of the electrode material; polyaniline is coated on the porous graphene and is taken as the surface layer of the electrode material; the gold is 10-20 nanometers in thickness; the porous graphene is 20-40 nanometers in thickness; the polyaniline is 20-40 nanometers in thickness; the electrode material is 50-100 nanometers in total thickness. The micro super capacitor nano-device has the beneficial effects that a micro energy storing device can store more energy on the premise of ensuring high electronic conduction, so that the capacity and energy density of a super capacitor are further increased.

Super capacitor with graphene electrodes

The invention discloses a super capacitor with graphene electrodes. The super capacitor comprises a shell, and two graphene electrodes parallel to the side wall of the shell are arranged inside the shell. Electrolyte fills the gap between the two graphene electrodes. A diaphragm is arranged between the two graphene electrodes. The end part of each graphene electrode is provided with a lead, and the leads are threaded out of the shell to be connected with pins arranged on the shell. The super capacitor has the advantages of high energy density and higher power density than a rechargeable battery, can be charged and discharged quickly, has a long service life, has very wide ranges of voltage and working temperature, and is a novel, efficient and practical energy storage device.

Production method of carbon nano-tube and nickel oxide combined electrode material

The invention belongs to the field of production of electrode material and provides a production method of carbon nano-tube and nickel oxide combined electrode material high in specific capacitance. According to the production method, carbon nano-tubes are used as base material, the surface of each carbon nano-tube is modified via nitric acid reflow, nickel hydroxide is deposited on the carbon nano-tubes subjected to nitric acid reflow treatment by means of the sol-gel method, and thermal treatment is performed to obtain the carbon nano-tube and nickel oxide combined electrode material. A combined electrode produced by the production method has specific capacitance up to 160 F/g.

Preparation method of metal oxide/carbon nano tube composite electrode material

The invention relates to a preparation method of a metal oxide/carbon nano tube composite electrode material. According to the method, the force of Van der Waals can be generated or pi-pi conjugation can be formed between a non-covalent modified carbon nano tube surface and an imidazole metal chloride salt imidazole ring, so that a metal oxide is uniformly loaded to the carbon nano tube surface by a metal cation -pi bond, and the metal oxide/carbon nano tube composite electrode material is formed. The load capacity of the metal oxide on the surface of a carbon material can be effectively increased, the surface energy of the carbon materials is reduced while a carbon atom hybrid structure on the surface of the carbon material is not damaged, and the metal oxide is uniformly loaded to the surface of the carbon material. The prepared metal oxide/carbon nano tube composite electrode material has a large specific surface area and relatively high metal oxide loading capacity and is widely applied in each field.

图 1

Organic electrolyte and symmetric super capacitor

The invention provides an organic electrolyte, which comprises an electrolyte and an organic solvent, and is characterized in that the electrolyte is tetramethyl ammonium oxalyldifluoroborate; the organic solvent is a mixer of propylene carbonate and ethylene carbonate; and the volume percentage content of ethylene carbonate is 0 to 80%. The organic electrolyte, an activated carbon positive electrode, an activated carbon negative electrode, and a diaphragm between the activated carbon positive electrode and the activated carbon negative electrode together form a symmetric super capacitor. As the tetramethyl ammonium oxalyldifluoroborate is high in solubility and strong in ionizing power, and in match with ethylene carbonate, the electrical conductivity of the organic electrolyte system can be improved. The symmetric super capacitor formed by the organic electrolyte has better rate capability. The experiment result shows that the symmetric super capacitor of the invention has higher power density and energy density than the existing symmetric super capacitor under the same current density.

Method for preparing super capacitor on basis of three-dimensional porous graphene composite material

The invention relates to a method for preparing a super capacitor on the basis of a three-dimensional porous graphene composite material. The method comprises the following steps of grinding and mixing the three-dimensional porous graphene composite material, acetylene black and a polytetrafluoroethylene emulsion with the mass fraction of 15 percent in the weight part ratio of (76-84):(12-18): (5-8) into electrode slurry, and uniformly dispersing the electrode slurry into a small amount of anhydrous alcohol to form paste liquid, and coating the paste liquid onto the surface of foam nickel to form a thin sheet to obtain an electrode plate; taking a polypropylene porous film as a septum, soaking the septum in electrolyte aqueous solution, placing the soaked septum between two electrode plates, and packaging to prepare the super capacitor of the two electrode plates. The method is based on the three-dimensional porous graphene composite material; when the packaging current density is 0.1 A/g, the specific capacity can be between 236 and 160f/g.

Method for preparing graphene-based vanadium pentoxide nanowire super capacitor electrode material

The invention belongs to the fields of material science and electrochemistry, and particularly relates to a method for preparing a graphene-based vanadium pentoxide nanowire super capacitor electrode material. The method comprises the following steps: performing a hydrothermal reaction for 1-2 days at the temperature 100-160 DEG C by taking metavanadate and graphene oxide as main raw materials; reducing and washing to obtain the graphene-based vanadium pentoxide nanowire composite materials. The preparation method is short in reaction time, is low in temperature, is simple in process, and is low in cost. The prepared graphene-based vanadium pentoxide nanowire super capacitor electrode material has the advantages of high electric conductivity of graphene, large specific surface area, high power characteristic and high graphene-based vanadium pentoxide nanowire energy density, and can be taken as a novel super capacitor electrode material hopefully.

Method for dispersing complex conducting agent in electrode slurry for lithium ion capacitor

The invention discloses a method for dispersing a complex conducting agent in an electrode slurry for a lithium ion capacitor. The method comprises the following steps: (1) material weighing: weighing 0.5-14.5% of graphene, 5.5-14.5% of a carbon nano tube and the balance of conducting carbon black, weighing N-methylpyrrolidone which is 4-9 times of the mass of the complex conducting agent, and weighing a surfactant which accounts for 5-15% of the mass of the complex conducting agent, wherein the grapheme, the carbon nano tube and the conducting carbon black constitute the complex conducting agent, and all the materials are weighed for standby application; (2) step-by-step material adding for dispersion: mixing the complex conducting agent with N-methyl-pyrrolidone and the surfactant for ultrasonic dispersion firstly, adding the carbon nano tube for first high-speed dispersion secondly, and adding the grapheme for second high-speed dispersion finally. The method is simple in process sequence, high in operability, and suitable for industrialized production, and has the advantages that the complex conducting agent can uniformly disperse to form a three-dimensional conducting network structure, and the power performance can be obviously improved when the relatively high energy density of capacitance is retained.

Asymmetric micro lithium ion capacitor and manufacturing method thereof

The invention discloses an asymmetric micro lithium ion capacitor and a manufacturing method thereof, and belongs to the field of micro energy and micromachining. The asymmetric micro lithium ion capacitor adopts the structure that a positive composite layer and a negative composite layer are arranged above the substrate of the device in sequence and are arranged at intervals in the horizontal direction; a photoresist membrane is formed between the positive composite layer and the negative composite layer. Each of the composite layer adopts the structure that a metal current collecting layer, an extraction layer and an electrode are mounted on the substrate of the device in sequence; a positive electrode and a negative electrode are of an interdigitated electrode structure which is formed by a positive composite electrode material and a negative composite electrode material respectively. The manufacturing method for the asymmetric micro lithium ion capacitor is characterized in that the two electrodes of the device are made of electrode materials based on different mechanisms, specifically, the anode is made of a double-electrode-layer material, and the cathode is made of a lithium ion battery material; a membrane structure is adopted to implement separate filling molding of different materials; moreover, the negative battery electrode of the device is subjected to pre-lithiation. The asymmetric micro lithium ion capacitor manufactured by the method is high in energy density, and has an excellent power output capability.

Graphene aerogel three-component compound electrode material of supercapacitor as well as preparation and application

The invention discloses a graphene aerogel three-component compound electrode material of a supercapacitor as well as preparation and an application. The electrode material comprises graphene, molybdenum disulfide and polyaniline, wherein graphene serves as aerogel and achieves a frame effect, so that molybdenum disulfide and polyaniline are uniformly dispersed on a graphene aerogel sheet layer. In an electrochemical characterization test, for the specific capacitance value, the maximum specific capacitance value can reach 776 F/g under 1 A/g; for the rate performance, the current intensity is increased to 20 A/g and the specific capacitance value is reserved by more than 60%; for the cyclic stability, the specific capacitance value can be reserved by more than 93% through 2,000-time constant-current cyclic charge and discharge. With cationic pretreatment and freeze-drying methods, the molybdenum disulfide-polyaniline-graphene aerogel compound material is obtained. The prepared molybdenum disulfide-polyaniline-graphene aerogel compound material is excellent in electrochemical performance, thereby having a good application prospect in the field of energy resources.

Nickel cobaltate doped with silicon nanosheet and preparation method of nickel cobaltate

The invention discloses a nickel cobaltate doped with a silicon nanosheet and a preparation method of the nickel cobaltate. The synthesis method comprises steps as follows: firstly, synthesizing a compound of the silicon nanosheet coated with simple nickel; taking the simple nickel coating the silicon nanosheet as a nickel source, adding the nickel to a deionized water solution of cobalt chloride, and preparing a nickel-cobalt hydroxide doped with the silicon nanosheet through a hydrothermal reaction; washing the product with ethanol and deionized water respectively after cooling the nickel-cobalt hydroxide to the room temperature, and after centrifugal separation, heating and annealing a precipitation precursor obtained through drying in the air to obtain sea-urchin-shaped nickel cobaltate doped with the silicon nanosheet. The nickel cobaltate composite material doped with the silicon nanosheet has excellent supercapacitor performance and cycle stability, and the preparation method is simple and environment-friendly; besides, the synthesized nickel cobaltate doped with the silicon nanosheet is used as an electrode material of supercapacitors and is superior to existing transition metal oxide electrode materials in cost.

Non-carbon supercapacitor electrode modification material with pseudocapacitance characteristic and method for modifying supercapacitor electrode

The invention discloses a non-carbon supercapacitor electrode modification material with a pseudocapacitance characteristic and a method for modifying a supercapacitor electrode, relates to a novel application of (La(1-x) Srx) (1-y)MnO(3-delta) and a method of (La(1-x)Srx)(1-y)MnO(3-delta) for modifying the supercapacitor electrode, aims to solve the technical problem of low electronic conductivity of MnO2, and belongs to the field of a novel application of (La(1-x)Srx)(1-y)MnO(3-delta) and the supercapacitor electrode modification material adopting (La(1-x)Srx)(1-y)MnO(3-delta). (La(1-x)Srx)(1-y)MnO(3-delta) is taken as the modification material to modify the electrode. The method comprises the following steps: preparing an electrode powder suspension; dipping and drying an electrode current collector to obtain the electrode. The electronic conductivity of the electrode modification material is higher than that of MnO2 by six orders of magnitude, the electronic conductivity of the electrode modification material at the room temperature is 45 S/cm, when the MnO2 electrode is modified with the material, and the specific capacitance of the electrode during high-rate/high-current discharge can be increased by about 50%.

Preparation method of titanic oxide and supercapacitor of titanic oxide

The invention provides a preparation method of titanic oxide. The method comprises the following steps: firstly, preparing nanoscale TiO2 material through an electrostatic spinning method; secondly, ensuring that an alkaline aqueous solution or an alkaline organic solution reacts with the nanoscale TiO2 material obtained in the first step; thirdly, filtering, and drying to obtain conductive titanic oxide. The invention further provides a supercapacitor prepared by the titanic oxide. The titanic oxide is prepared through an electrostatic spinning method and is subjected to chemical treatment, the conductivity of the titanic oxide is greatly improved, and the titanic oxide is converted into a semiconductor with good conductivity from a nonconducting insulator, and is applied to the electrode material of the supercapacitor. The titanic oxide electrode material of the supercapacitor greatly increases the specific capacitance, the power density and the energy density value of the supercapacitor, and has excellent characteristics of low cost, environmental protection, high use ratio, stable performance, high practicability and the like.

Preparation method of button-type double electric layer capacitor

The invention relates to the technical field of material chemical preparation, in particular to a preparation method of a button-type double electric layer capacitor. The preparation method of the button-type double electric layer capacitor comprises the following steps: compounding a mixed liquor of a concentrated sulfuric acid and a concentrated nitric acid, pouring the mixed liquor into a beaker containing natural flake graphite, and standing the mixture of the mixed liquor and the natural flake graphite for 24 hours; filtering out the graphite, washing with water until a pH value is greater than 5, and drying; performing quick expansion for 1 minute, mixing activated carbon powder with the expanded graphite, dropwise adding anhydrous alcohol to the mixture of the activated carbon powder and the expanded graphite while stirring, and soaking, performing ultrasonic oscillation and vacuum drying so as to obtain an expanded graphite/activated carbon (EP/AC) composite material; mixing the expanded graphite/activated carbon (EP/AC) composite material with conductive carbon black and polytetrafluoroethylene as a binder, dropwise adding anhydrous alcohol to the mixture until the mixture is pulpous, drying, and pressing the dried solid mixture and foam nickel so as to obtain electrode pieces; placing the electrode pieces face to face, using a KOH aqueous solution as an electrolyte, and assembling the electrode pieces to form the button-type capacitor. The preparation method disclosed by the invention can maintain higher specific capacitance under the condition of heavy current discharge, the decrease rate of the specific capacitance is smaller than 7%, and the button-type double electric layer capacitor prepared by the preparation method has good properties.

Preparation method of methyl green-modified reduced graphene oxide and application of methyl green-modified reduced graphene oxide as supercapacitor electrode material

The invention discloses a preparation method of methyl green-modified reduced graphene oxide. The preparation method comprises the following steps: ultrasonically dispersing graphite oxide in water to form graphite oxide dispersion liquid and dissolving methyl green in water to form methyl green solution; adding the graphite oxide dispersion liquid into the methyl green solution to stir uniformly, adding hydrazine hydrate as a reducing agent to react at 80-90 DEG C for 8-12 h, cooling the product to the room temperature, carrying out thermal treatment at 200-300 DEG C for 2-4 h after filtration, washing and drying so as to obtain the final product. Electrochemical performance tests indicate that the prepared methyl green-modified reduced graphene oxide shows relatively high electrochemical capacitance behavior, excellent double capacitance rate and favorable cycling stability, so that the methyl green-modified reduced graphene oxide is a relatively good supercapacitor electrode material. Moreover, the composite material provided by the invention is simple in preparation process, stable in process, easy to operate, reliable in quality, low in cost and beneficial for popularization and application.

Method for preparing urchin-like vanadium base nanometer electrode material and application of the material

The invention discloses a method for preparing an urchin-like vanadium base nanometer electrode material and application of the material. The method comprises the steps of adding vanadium pentoxide into aqueous hydrogen peroxide, and performing electromagnetic stirring in water bath to prepare a vanadium precursor solution; taking the vanadium precursor solution, ethylene glycol and deionized water and adding ammonium sulfate, controlling the solution within Ph2.0-3.0, performing electromagnetic stirring to mix the solution, and transferring the solution to a hydrothermal reaction kettle to perform hydrothermal reaction for 5-48h at 160-200 DEG C; centrifuging, washing and drying to prepare the electrode material. The invention further discloses a method for preparing an electrode plate, and the method is characterized in that the urchin-like vanadium base nanometer electrode material is mixed with a binder and a conductive agent according to the weight proportion of (70-80) to (0-10) to 10 and a current collector is coated with the mixture. According to the method, V205 with the relatively low price is regarded as a vanadium source without any surface active agent; the preparation process is simple, efficient, steady and economic, the morphology change of the material is slightly affected by heat treatment, and the prepared urchin-like vanadium base nanometer electrode material has high specific capacity and long cycling life in water electrolyte and organic electrolyte.

Optoelectronic devices with organometal perovskites with mixed anions

The invention provides an optoelectronic device comprising a mixed-anion perovskite, wherein the mixed-anion perovskite comprises two or more different anions selected from halide anions and chalcogenide anions. The invention further provides a mixed-halide perovskite of the formula (I) [A][B][X]3 wherein: [A] is at least one organic cation; [B] is at least one divalent metal cation; and [X] is said two or more different halide anions. In another aspect, the invention provides the use of a mixed-anion perovskite as a sensitizer in an optoelectronic device, wherein the mixed-anion perovskite comprises two or more different anions selected from halide anions and chalcogenide anions. The invention also provides a photosensitizing material for an optoelectronic device comprising a mixed-anion perovskite wherein the mixed-anion perovskite comprises two or more different anions selected from halide anions and chalcogenide anions.

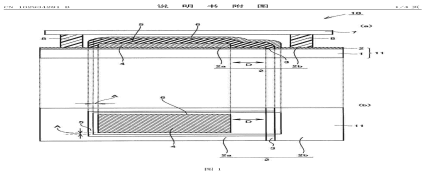
Inventor: FUKUI ATSUSHI; KOMIYA RYOICHI; YAMANAKA RYOHSUKE



Prio: JP 20100609 2010132247, JP 20110606 2011062936
Appl.No: CN201180028531
IPC: H01G 9/20

Preparation of cobalt-bismuth composite oxide and application of cobalt-bismuth composite oxide in preparation of super capacitor electrode

Publication: CN 102969164 B 20150513

Applicant: UNIV NORTHWEST NORMAL
Inventor: HU ZHONGAI; JIA PENGFEI; LI XIAOTING; LI ZHIMIN; WU HONGYING; YANG YUYING
Prio:
Appl.No: CN201210537887
IPC: H01G 9/042

9

Self-adaption temperature compensating capacitor

Publication: CN 102983001 B 20150513

Applicant: SUZHOU FURUI MUTUAL INDUCTOR CO LTD
Inventor: LI DONGHONG; LUO CHENGMU; WANG QIANG; ZHANG DONGBO; ZHANG GUIXIN
Prio:
Appl.No: CN201210504599
IPC: H01G 4/002

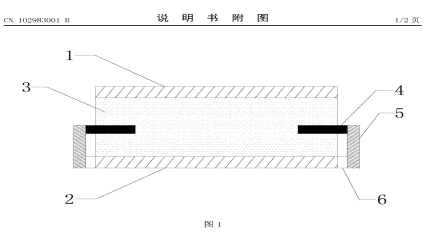

图 1

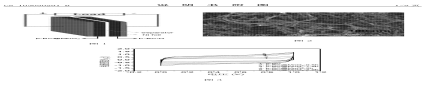
6

Asymmetric electrochemical capacitor and preparation method of asymmetric electrochemical capacitor

Publication: CN 103050291 B 20150527

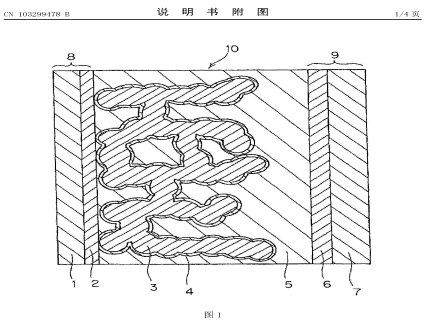
Applicant: USTC UNIV SCIENCE TECH CN



Inventor: CHEN LIFENG; HUANG ZHIHONG; YU SHUHONG
Prio:
Appl.No: CN201210584441
IPC: H01G 11/30

Photoelectric conversion element

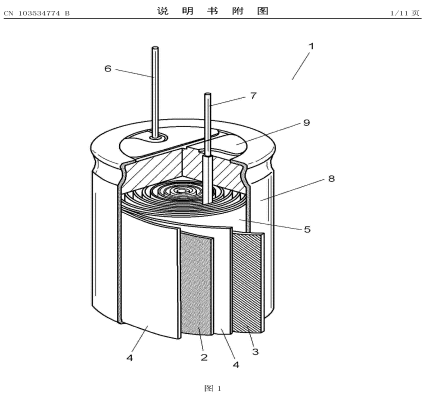
Publication: CN 103299478 B 20150520
Applicant: DAI ICHI KOGYO SEIYAKU CO LTD
Inventor: SAITO YASUTERU
Prio: JP 20110113 2011004940, JP 20110622 2011138488, JP 20120111 2012000125
Appl.No: CN201280004961
IPC: H01G 9/20



20

Electrode foil,method for manufacturing electrode foil, and capacitor

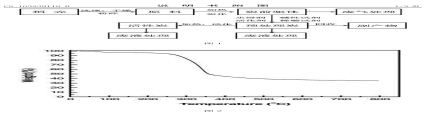
Publication: CN 103534774 B 20150527
Applicant: PANASONIC CORP
Inventor: HIROKI KAMIGUCHI; HITOSHI ISHIMOTO; MASASHI SHOJI
Prio: JP 20110516 2011109039, JP 20120514 2012003123
Appl.No: CN201280023561
IPC: H01G 9/04



12

Preparation method of activated carbon for electrochemical energy storage device

Publication: CN 103539119 B 20150506
Applicant: CHINA FIRST AUTOMOBILE WORKS



Inventor: CHEN SHULI; HAN JINLEI; RONG CHANGRU; WEI XIAOCHUAN; ZHANG KEJIN
Prio:
Appl.No: CN201310521542
IPC: H01G 11/34

Preparation method of graphene composite electrode material

Publication: CN 103745829 B 20150520

Applicant: SHENZHEN CHINA STAR OPTOELECT
Inventor: WANG YEWEN
Prio:
Appl.No: CN201310746256
IPC: H01G 9/042
